Dr. Oppel of Stuttgart (about A.D. 1856), Dr. Wright of Cheltenham (1860), and others, have divided the Lias into different zones, distinguished from each other by the occurrence in them of typical ammonites. The zones at present recognised are here presented in an ascending series, commencing with the oldest. Geologists quote them in such a form as this: The zone of *Ammonitis planorbis* at the base of the Lower Lias, the zone of *A. capricornus* in the Middle Lias, &c. [ZONE.]

Lower Lias: *A. planorbis, A. angulatus, A. Bucklandi, A. oxynotus.*

Middle Lias: *A. Jamesoni, A. capricornus, A. margaritatus, A. spinatus, A. annulatus.*

Upper Lias: *A. serpentinus, A. communis, A. Jurensis.*

ăm-mō′-nĭ-ŭm, *s.* [In Ger., &c., *ammonium.*]

Chem.: The name given by Berzelius to a supposed monatomic radical (NH_4)′. It is doubtful whether the ammonia salts—as chloride of ammonium, NH_4Cl—contain this radical, that is, whether N is sometimes a pentatomic element, or the molecule of NH_3 is united with the acid, as HCl, by molecular attraction—thus, $NH_3.HCl$—in the same manner as water of crystallisation is united in certain crystalline salts. At high temperatures this salt is decomposed into NH_3 and HCl. The so-called amalgam of mercury and ammonium decomposes rapidly into hydrogen ammonia and mercury. It is formed by placing sodium amalgam in a saturated solution of NH_3HCl. It forms a light, bulky, metallic mass. A dark-blue liquid, said to be $(NH_4)_2$ (ammonium), has been formed at low temperature and high pressure. But many of the salts of ammonium are isomorphous with those of potassium and sodium. The salts of ammonium give off NH_3 when heated with caustic lime or caustic alkali. With platinic chloride they give a yellow precipitate of double platinic ammonium chloride; also with tartaric acid a nearly insoluble white crystalline precipitate of acid tartrate of ammonia. The salts of ammonium leave no residue when heated to redness.

In the development of the higher animals, the germinal membrane, at a very early period, separates into two layers: the external one serous, and the internal one mucous. "This messanger *a-morwe* whan he awook."
Chaucer: C. T., 5,226.

Ā′-mŏs, *s.* [Heb. עָמוֹס (*Amos* or *Ghamos*).]

1. A Hebrew prophet; not to be confounded, as some of the early Christian writers did, with Amoz, the father of Isaiah, whose name, אָמוֹץ (*Amos*), has ס instead of ץ, and ש instead of ס. He was a native of Tekoa, about six miles south of Bethlehem, where he was a herdman and gatherer of sycomore fruit. Though a native of Judah, he prophesied in Israel, some time between 798 and 784 B.C. He was a contemporary of Isaiah and Hosea.

2. The book of the Bible called by the name of the foregoing prophet. Its Hebrew is excellent, though there are in it peculiarities of spelling. It has always been accepted as canonical. It is twice quoted in the New Testament (ch. v. 25, 26, in Acts vii. 42; and ix. 11 in Acts xv. 16).

ą-mō′-tion, *s.* [Lat. *amotio* = a removing or removal; from *amoveo* = to move away.] Removal.

"The Universities of England shall need no other punishment than what *amotion* of church honours and preferments will occasion them."—*Waterhouse: Apology for Learning*, &c. (1653), p. 91.

"The cause of his *amotion* is twice mentioned by the Oxford antiquary."—*T. Warton's Life of Sir T. Pope*, p. 251.

ą-mount′, *v.i.* [Fr. *monter* = to ascend, from *mont* = a mountain; Norm. & Fr. *amont* = up (a stream); Sp. *amontar*, *amontarse* = to get up into the mountains (*montar* = to mount, *monte* = a mount; *montana* = a mountain, *monta* = an amount); Port. *amontoar* = to heap or hoard up (*monte*, *montanha* = a mountain); Ital. *ammontare* = to heap up (*montare* = to amount; *montagna* = a mountain.) In all these languages *amount* and *mountain* are connected, suggesting the fact that if new items of debts, of assets, or of anything be constantly added to others which have gone before, the sum total will ultimately be (at least, hyperbolically speaking) mountain-high.

I. *Lit.:* To go up, to mount.

"So up he rose, and thence *amounted* streight."
Spenser: F. Q., I. ix. 54.

II. *Figuratively:*

1. To run into an aggregate by the accumulation of particulars; to mount up to, to add up to.

"Thy substance, valued at the highest rate,
Cannot *amount* unto a hundred marks."
Shakesp.: Comedy of Errors, i. 1.

". . . he had a taste for maritime pursuits, which *amounted* to a passion, indeed almost to a monomania."—*Macaulay: Hist. of Eng.*, ch. xxiii.

2. To count for, to deserve to be estimated at, when everything bearing on the case is allowed for.

"Thus much *amounteth* all that ever he ment."
Chaucer: C. T., 10,422.

ą-mount′, *s.* [From the verb.]

1. The total, when two or more sums are added together.

"The *amount* was fixed, by an unanimous vote."—*Macaulay: Hist. Eng.*, ch. xxiii.

2. The result when the effect of several causes is estimated.

"And now ye lying vanities of life,
Where are you now, and what is your *amount*?
Vexation, disappointment, and remorse."
Thomson.

ą-mount′-ĭng, *pr. par.* [AMOUNT, *v.*]

ăm′-oûr, * **ăm′-oûre**, *s.* [Fr., from Lat. *amor* = love.] A love affair; an affair of gallantry. (Used almost exclusively of illicit love.)

"But lovely peace, and gentle amity,
And in *Amours* the passing howres to spend."
Spenser: F. Q., II. vi. 35.

"Grey and some of the secrets who had served him in his *amour* were brought to trial on a charge of conspiracy."—*Macaulay: Hist. Eng.*, ch. v.

* **ą-mŏŭs′e**, *s.* [Possibly from Gr. ἄμουσος (*amousos*) = . . . unpolished, rude, gross.] A counterfeit gem or precious stone. (*Glossog. Nova*, 2nd ed., 119.)

* **ą-mō′v-ąl**, *s.* [Eng. *amove*; *-al.*] Complete removal.

"The *amoval* of these insufferable nuisances would infinitely clarify the air."—*Evelyn.*

* **ą-mō′ve**, *v.t.* [Fr. *émouvoir*, from Lat. *amoveo* = to remove away: *a* = from; *moveo* = to move.]

"She no lesse glad then he desirous was
Of his departure thence
That she well pleased was thence to *amove* him farre."
Spenser: F. Q., II. vi. 37.

2. To move, to inspire with emotion. (This sense is not from Lat. *amoveo* = to move away, to remove, but from the simple verb *moveo* = to move.)

"And him *amoves* with speaches seeming fit,
'Ah, deare Sansloy' . . ."
Spenser: F. Q., I. iv. 48.

***a-mo̍v-ĭng,** *pr. par.* [AMOVE, *v.*]

ămp-ar-thros'-ĭs, *s.* [AMPHIARTHROSIS.]

ăm-pĕl'-ĭ-dæ, *s. pl.* [From *Ampelis* (q.v.).] Chatterers. A family of birds belonging to the order Passeres, and the sub-order Dentirostres. They stand between the Laniidæ, or Shrikes, and the Muscicapidæ, or Fly-catchers. They chiefly inhabit the warmer regions. They are often very beautiful in their plumage. They feed on fruits and insects. The Ampelidæ may be divided into six sub-families: (1) Dicrurinæ, or Drongo Shrikes; (2) Campephaginæ, or Caterpillar-eaters; (3) Gymnoderinæ, or Fruit Crows; (4) Ampelinæ, or True Chatterers; (5) Piprinæ, or Manikins; and (6) Pachycephalinæ, or Thick-heads.

ăm-pĕl-ĭd'-ē-æ, *s. pl.* [From Gr. ἄμπελος (*ampelos*) = a vine.] Vine-worts. An order of plants placed by Lindley under the Berberal Alliance. They are called also Vitaceæ. The calyx is small; the petals 4—5; the stamens as many, and inserted opposite to the petals; the ovary two-celled; the berry often by abortion one-celled, with few seeds. There is not a modern genus Ampelos.

ăm-pĕl-ī'-næ, *s. pl.* [AMPELIDÆ (4).]

ăm'-pĕl-ĭs, *s.* [Gr. ἀμπελίς (*ampelis*) = dimin. from ἄμπελος (*ampelos*) = (1) a young vine, (2) a kind of bird.] The typical genus of the family of birds called Ampelidæ, or Chatterers. The beautiful Bohemian Chatterer is *Ampelis garrula.* [CHATTERER.]

ăm'-pĕl-īte, *s.* [Gr. ἀμπελῖτις (*ampelitis*) = pertaining to the vine, γῆ ἀμπελῖτις (*gē ampelitis*) = "vine-earth;" Lat. *ampelitis* = a kind of bituminous earth with which the vine was sprinkled as a preservative against worms; from ἄμπελος (*ampelos*) = a vine.] Perhaps a preparation of cannel-coal, with which husbandmen in France smear their vines to kill insects. [CANNEL-COAL.]

ăm-pĕl-ŏp'-sĭs, *s.* [Gr. ἄμπελος (*ampelos*) = vine, and ὄψις (*opsis*) = look, appearance.]

ăm-phĭ-ar-thrō'-sĭs, *s.* [Gr. ἀμφί (*amphi*) = on both sides; ἄρθρωσις (*arthrōsis*), or, more classically, ἀρθρωδία (*arthrōdia*) = articulation; ἀρθρόω (*arthroō*) = to fasten by a joint; ἄρθρον (*arthron*) = a joint; * ἄρω (*arō*) = to join; Sansc. *ar.*]

Anat.: A form of articulation in which two plane or mutually adapted surfaces are held together by a cartilaginous or fibro-cartilaginous lamina of considerable thickness, as well as by external ligaments.

¶ It is considered by Todd and Bowman to be a variety of the synarthrodal joint. In man it occurs in the articulations between the several vertebræ, between the ossa pubis, and between the ilium and the sacrum.

ăm-phĭb'-ĭ-ą, *s. pl.* [Neut. pl. of ἀμφίβιος (*amphibios*) = living a double life, *i.e.*, both on land and water; Gr. ἀμφί (*amphi*) = double, and βίος (*bios*) = life.] [AMPHIBIUM.]

Zoology: Animals which can live indiscriminately on land or water, or which at one part of their existence live in water and at another on land. It is used—

1. By Linnæus for the third of his six classes of animals. He includes under it reptiles in the wide sense of the word, with such fishes as are most closely akin to them. He divides the class into three orders, Reptiles, Serpentes, and Nantes.

2. By Cuvier, in his *Règne Animal,* for his third tribe of Carnivorous Mammalia, the first and second being the Plantigrades and Digitigrades. He included under it the Seals and their allies. In his *Tableau Elémentaire,* the arrangement is different, the Amphibia being an order ranked with the Cetacea (Whales), under his third grand division, Mammalia, which have extremities adapted for swimming, the first being "Mammalia which have claws or nails," and the second "those which have hoofs."

3. By Macleay, Swainson, Huxley, and other modern zoologists, the fourth great class of animals corresponding to Cuvier's reptilian order Batrachia. It is intermediate between Reptilia and Pisces. They have no amnion. Their visceral arches during a longer or shorter period develop filaments exercising a respiratory function, or branchiæ. The skull articulates with the spinal column by two condyles, and the base occipital remains unossified. But Huxley divides them into four orders, the Urodela, the Batrachia, the Gymnophiona, and the Labyrinthodonta. The frog, the toad, and the newt are familiar examples of the Amphibia.

1. Capable of living both on land and in water.

"As soon as the young [crocodiles] are born, they hasten to cast themselves into the water, but the greater number of them become the prey of tortoises, of voracious fish, of *amphibious* animals, and even, as is said, of the old crocodiles."—*Griffith's Cuvier,* vol. ix., p. 186.

"Sixty years is usually the age of this detested *amphibium* [the crocodile], whether it be beast, fish, or serpent."—*Sir T. Herbert: Travels,* p. 364.

ăm-phĭb'-ŏ-lē, *s.* [In Lat. *amphibolus;* from Gr. ἀμφίβολος (*amphibolos*) = doubtful, ambiguous; ἀμφιβάλλω (*amphiballō*) = to throw around as a garment; *v.i.*, to turn out uncertainly: ἀμφί (*amphi*) = around: βάλλω (*ballō*) = to throw.] The name of a mineral, or great mineral genus which the British Museum Catalogue makes synonymous with Hornblende. Dana considers that the term Amphibole proposed by Haüy should have the precedence, inasmuch as that distinguished scientist was the first rightly to appreciate the species, bringing together under it hornblende, actinolite, and tremolite. It varies much in composition, and its constituent elements will be best exhibited under its several varieties. These Dana classifies as follows:—

I. *Containing little or no alumina:*

1. Magnesia — Lime — Amphibole = Tremolite.
2. Magnesia — Lime — Iron — Amphibole = Actinolite.
3. Magnesia—Iron—Amphibole = Antholite.
4. Magnesia — Lime — Manganese — Amphibole = Richterite.
5. Iron—Magnesia—Amphibole = Cummingtonite.
6. Iron—Manganese—Amphibole = Dannemorite.
7. Iron—Amphibole = Grünerite.
8. Asbestus.

II. *Aluminous:*

9. Aluminous Magnesia — Lime — Amphibole = (*a*) Edenite, (*b*) Smaragdite.
10. Aluminous Magnesia—Lime—Iron Amphibole = (*a*) Pargasite, (*b*) Hornblende.
11. Aluminous Iron—Lime—Amphibole = Noralite.
12. Aluminous Iron—Manganese—Amphibole = Camsigradite. (See these words.)

¶ Dana makes Amphibole the type of a group, and also a sub-group, of minerals, which he classes at the head of his Bisilicates.

ăm-phĭ-bŏl'-ĭ-ą, ăm-phĭb'-ŏl-ў, *s.* [Lat. *amphibolia,* from Gr. ἀμφιβολία (*amphibolia*) = (1) the state of being attacked on both sides; (2) ambiguity. From Greek ἀμφίβολος (*amphibolos*) = (1) put round as a garment; (2) attacked from both sides; (3) ambiguous: ἀμφιβάλλω (*amphiballō*) = to put round, to surround, to double; ἀμφί (*amphi*), and βάλλω (*ballō*) = to throw.]

A. *Chiefly in the form* Amphibolia:

Logic: What logicians have described as the *fallacia amphibolicæ.* It occurs when a sentence, though consisting of words each of which, taken singly, is unambiguous in its meaning, is yet itself susceptible of a double signification, on account of the order in which the words are arranged, or for some similar reason. The Latin language was particularly liable to afford examples of amphibology—a fact well known to those who gave forth the "prophetic" utterances of the ancient oracles, as in the famous answer returned to Pyrrhus when he asked counsel as to whether he would be successful if he invaded the Roman empire, "Aio te, Æacida, Romanos vincere posse" ("I say that you, O son of Æacus, can conquer the Romans;" or "I say that the Romans can conquer you, O son of Æacus"). Similarly, the witch "prophecy" in English, "The Duke yet lives that Henry shall depose," may mean "The Duke yet lives who shall depose Henry," or, "whom Henry shall depose;" but it may be said that the word *that* is ambiguous, and that consequently the sentence is an example not of amphiboly, but of equivocation. (See *Whately's Logic,* 9th ed., 1848, bk. iii., § 204.)

B. *In the form* Amphiboly:

Ordinary Language: In the same sense as that given under A., *Logic.*

"Come, leave your schemes,
And fine *amphibolies.*"
Ben. Jonson: Magn. Lady, ii. 5.

"If it oracle contrary to our interest or humour, we will create an *amphiboly,* a double meaning where there is none."—*Whitlock: Manners of the Eng.,* p. 254.

"Making difference of the quality of the offence may (say they) give just ground to the accused party either to conceal the truth, or to answer with such *amphibolies* and equivocations as may serve to his own preservation."—*Bp. Hall: Cases of Conscience*

2. *Of words:* Susceptible of a double construction, though the meaning of each word, taken singly, is apparent.

"An *amphibolous* sentence is one that is capable of two meanings, not from the double sense of any of the words, but from its admitting of a double construction."—*Whately: Logic*, 9th ed. (1848), bk. iii., § 10.

ăm-phĭc′-tў-ŏnş, *s. pl.* [According to the Greeks, from an ancient hero, Amphictyon, said to have founded the most celebrated of the Amphictyonic associations; but he seems to have been a myth invented and named in order to explain the existence of the association. Doubtless from Gr. ἀμφικτίονες (*amphiktiones*) = they that dwell near, next neighbours; ἀμφί (*amphi*) = round about; and κτίζω (*ktizō*) = to people a country.] Delegates from twelve of the states of ancient Greece which entered into a league to protect the temple of Apollo at Delphi, and to promote peace among the confederate states. The conception was a noble one, but, like the Holy Alliance in modern times, the performance was of a different character. The Amphictyonic League were chiefly responsible for two cruelly-conducted wars, and on the whole exerted an evil rather than a beneficial influence. Besides the association which attained such celebrity, and which met in the spring at Delphi, and in the autumn at a temple of Demeter, within the pass of Thermopylæ, there were other ancient Amphictyonies of lesser celebrity.

employed. The place where the exhibitions took place was called the *arena* (Lat. = sand), because it was covered with sand or sawdust. The part next the *arena* was called *podium*, and was assigned to the emperor, the senators, and the ambassadors of foreign nations. It was separated from the arena by an iron railing and by a canal. Behind it rose tiers of seats, the first fourteen, which were cushioned, being occupied by the *equites*, and the rest, which were of bare stone, being given over to the common people. Except when it rained, or was exceedingly hot, the amphitheatre was uncovered. Among the sights were combats of wild beasts and gladiator fights. The Romans built amphitheatres wherever they went. III. *Astron.:* The angular distance from the east point of a heavenly body at the moment of its rising, or from the west point at the instant when it sets. Depending, as it does, on the declination of the heavenly body and the latitude of the place, the sine of the amplitude is equal to the sine of the declination, divided by the cosine of the latitude. The amplitude of the fixed stars remains unaltered during the year; that of the sun on the contrary, greatly varies: standing at nothing at the vernal and autumnal equinoxes, and 39° 44′ in the latitude of London at the summer and winter solstices. Amplitude, measured when the sun or a star rises, is called *ortive*, or *eastern*; and that when it sets, *occiduous*, or *western*. If a star rise north of the east point, its ortive amplitude is northern, and its occiduous amplitude southern, and *vice versâ*. The azimuth of a heavenly body is the complement of its amplitude.

Magnetic amplitude is an amplitude measured not from the true, but from the magnetic east or west.

amplitude compass, *s.* A compass designed to aid in measuring the amplitude of the sun or other celestial body at its rising or setting.

This is an amulet, or talisman, which having been blessed by a Brahman, has then been sold for half a rupee (about a shilling), or even for a rupee itself, as a sure preservative against fever. [See Talisman, Charm.]

¶ In this, as in other senses, it is sometimes used reciprocally, when it means to deceive or delude one's self with some vain imagination.

Church Hist. & Theol.: The tenets of Amyrald and his followers. They were that God desires the happiness of all men, and that none are excluded from it by an eternal decree. That those who would be saved must believe in Christ. That the power of believing is refused to none, but divine assistance effective for the purpose is not bestowed on all. These views were called Universalist, but they were so in words rather than in reality.

They occur in the tropics of India and America, in the latter region extending as far north as Florida. In 1846, Lindley estimated the known species at forty-five.

ĕm´-ȳr-ĭs, *s.* [Lat. *myrrha* and *myrrhis*; Gr. *μυῤῥίς* (*murrhis*) = a plant, *Myrrhis odorata.*] The typical genus of the Amyridaceæ, or Amyrid order of plants. It has a finely smelling resinous gum. *A. Gileadensis* produces the celebrated Balm of Gilead. [BALM.] The *A. toxifera* is said to be poisonous. The *A. Plumieri* and the *A. hexandra* furnish part of the Gum Elemi of commerce. The wood of *A. balsamifera* in Jamaica yields one kind of Lignum Rhodium. The layers of the liber of a species belonging to the same genus are employed by the Nubian Mohammedans for paper. (*Lindley: Veg. Kingd.*, p. 460.)

* **ą-mȳs´,** *adv.* Old spelling of AMISS.

ą-mȳz´-tlĭ, *s.* The Mexican name of a species of Sea-lion (*Otaria*), found on the sea-coasts and estuaries of the American Pacific coast. Its skin is valued on account of the length and softness of its hair.

ăn, *article.* [A.S. *an*, *œn* = (1) one; (2) single, sole, another; (3) a certain one, some one; (4) any, every one, all. In Sw. *en*; Dan. *en*, *een*; Dut. *een*, *eene*; Ger. *ein*; Gael. *aon*; Irish *éin*, *eain*, *aon*; Welsh *un*, *yn*; Cornish *unyn*; Arm. *unan*; Lith. *wena*; Fr. *un*, *on*; Sp. *uno*, *un*; Port. *hum*; Ital. *uno*; Lat. *unus*; Gr. *εἷς* (*heis*), masc., *ἓν* (*hen*), neut. = one.] [ONE.]

I. *Its form:* The indefinite article, and at first its only form, being placed before words beginning with a consonant, no less than those commencing with a vowel, as is still the case with the similar word *one*. [ONE.] (See the subjoined examples in which *an* is used before a consonant.)

"He it setten on *an* mirie stede."
Story of Gen. and Exod. (1250), ed. Morris, 680.
"In a weie *an* time he cam."—*Ibid.*, 1,435.
"On *an* busk rane and wel tidi."—*Ibid.*, 2,015.
"*An* kire."—*Ibid.*, 2,451.
"*An* wis man."—*Ibid.*, 2,649.
"*An* sel."—*Ibid.*, 2,709.

Now the form *a* occurs as well as *an*. For rules as to when the one and when the other is employed, see *A as a part of speech* (A., V., page 1). See also Moon's *Bad English* (1868), pp. 56, &c.

¶ In some words now beginning with *n*, that letter has become detached from *a*, and has adhered to the commencement of the subsequent word, which formerly began with a vowel. Thus, in East Anglia, according to Forby, an ass is called a *nasil* or *nazzle*, i.e., *an asil*, or *an azzle*. Similarly, a newt, originally called an *eft*, *evet*, or *ewt*. In *adder*, again, the contrary appears to have happened: it was at first a *nadder*, and became *an adder*. So also with *apron*, originally *napron*. [ADDER, NATRIX.]

II. *Its signification:* The primary signification of *an* is (1) *one*, in a very indefinite sense, *any one*; (2) *each*; (3) *any*; (4) *one in particular*; (5) *every*. [See *A as a part of speech* (A., V., p. 1). See also Moon's *Bad English*, p. 89.] Sometimes *an*, like *a*, is placed before a participle or an adjective without in any way altering the meaning.

"And when he had fasted forty days and forty nights, he was afterward *an* hungred."—*Matt.* iv. 2.

ăn, *conj.* [A contracted form of AND (q.v.). Wedgwood thinks this may have come from *e'en*, a contraction of *even*; O. Sw. *œan* = and yet, still, continuously. Horne Tooke derives it from A.S. *unnan* = to give. In Lat. *an* is = or, or whether; Gr. *ἄν* (*an*), contraction from *ἐάν* (*ean*) = if, haply, perchance; Arab. & Sam. *an* = if; E. Aram. ܐܢ (*an*), and ܐܝ (*ayin*) = if, or whether.]

¶ *An* is obsolete in English, but still exists in Scotch.

ăn, or **a,** as a *prefix*, derived from the Greek. [Gr. *ἀν* (*an*), or *ἀ*, generally called *ἀ* (*alpha*) privative, but *ἀν*, and not *ἀ*, is the original form. In English, Anglo-Saxon, Old Saxon, German of all ages, and Goth. *un*; Dut. *on*; Old Norse & Sw. *o*; Dan. *u*; Wel. *an*; Gael. *ana*, *an*, *am*; Lat. *in*; Sanse. *an*.] From a study of its use in Gaelic, Prof. Key infers that it originally signified *badly*, from which there came the senses (2) of negation, and (3) of intensity. Badness is a negation of good, and the more intense that it is, the more is it worthy of the name of *badness*. [See Prof. Key's *Philological Essays* (1868), pp. 127—148.] Now *an* priv. is used before a vowel, and *a* before a consonant, as *anomalous*, *atheist*.

1. *As a suffix:* Added to proper names, as an appellation of books consisting of clever or witty sayings of deceased men of eminence, and anecdotes relating them; some doubtless authentic, others as obviously mythic. This use of the term *ana* seems to have begun in France about the middle of the seventeenth century, whence it spread to other parts of the Continent, and to England. The Scaligerana, or Scaligeriana, appeared in two parts: the first ultimately called, however, *Scaligeriana Secunda*, first appeared in the year 1666; the former in 1699. Among other Continental *ana* the Menegeana came forth in 1692, and the Poggiana in 1720. England has had its Walpoliana, its Addisoniana, its Johnsoniana, its Swiftiana, its Mooriana, &c.; and some works like Boswell's celebrated Life of Johnson, though not called *ana*, might with much propriety receive the name. Sometimes *ana* is made a suffix to the name of a place, as *Tunbridgiana* = the gossip or scandal of Tunbridge Wells.

"They were pleased to publish some *Tunbridgiana* this season, but such *anas*! I believe there never were so many vile little verses put together before."—*West to Gray.*

A. *As substantive. Church History:*

1. A member of a well-known fanatical sect which largely figured in the ecclesiastical and civil history of the sixteenth century. It began to attract notice within four years of the ever memorable 31st of October, 1517, on which Luther affixed his "theses" to the gate of the castle church of Wittenberg. The most eminent of its early leaders were Thomas Münzer, Mark Stubner, and Nicholas Storck. They had been disciples of Luther; but becoming dissatisfied with the moderate character of his reformation, they cast off his authority, and attempted more sweeping changes than he was prepared to sanction. During his absence, they, in 1521, began to preach their doctrines at Wittenberg. Laying claim to supernatural powers, they saw visions, uttered "prophecies," and made an immense number of proselytes. The ferment which the exciting religious events taking place in Central Europe had produced in men's minds,

had made them impatient of social or political as well as of spiritual despotism; and in 1525 the peasants of Suabia, Thuringia, and Franconia, who had been much oppressed by their feudal superiors, rose in arms, and commenced a sanguinary struggle, partly, no doubt, for religious reformation, but chiefly for political emancipation. The Anabaptists cast in their lot with the insurgent peasantry, and became their leaders in battle. After a time the allied princes of the Empire, led by Philip, Landgrave of Hesse, put down the rebellion; and Munzer was defeated, captured, put to the torture, and ultimately beheaded. In 1532, some extreme Anabaptists from Holland, led by a baker called John Matthias, and a tailor, John Boccoldt, called also, from the place whence he came, John of Leyden, seized on the city of Münster, in Westphalia, with the view of setting up in it a spiritual kingdom, in which, at least nominally, Christ might reign. The name of Münster was changed to that of Mount Zion, and Matthias became its actual king. Having soon after lost his life in a mad warlike exploit, the sovereignty devolved on Boccoldt, who, among other fanatical freaks, once promenaded the streets of his capital in a state of absolute nudity. On the 24th of June, 1535, the Bishop of Münster retook the city by force of arms, and Boccoldt was put to death in the most cruel manner that could be devised. The excesses of the Anabaptists were eagerly laid hold of by the Popish party to discredit the Reformation. It was in the year 1534, when Boccoldt was in the height of his glory in Münster, that Ignatius Loyola took the first step towards founding the order of the Jesuits, and the extension and rapid success of that celebrated fraternity are to be attributed in a very large measure to the reaction against Protestantism produced by the share which the Anabaptists took in the peasants' war, and the character of the spiritual sovereignty which they set up while Münster was in their hands.

† 2. One belonging to the modern Baptist church. The term is used only by those who believe in infant baptism, and is properly becoming obsolete, there being an unfairness in using an expression which suggests a connection between the turbulent fanaties of Münster and the quiet law-abiding English Baptists. [ANABAPTISM.]

ăn′-ą-grăm, *s.* [In Sw. *anagram*; Ger. *anagramm*; Fr. *anagramme*; Sp. *anagrama*; Port. & Ital. *anagramma.* From Gr. ἀνά (*ana*) = backwards, and γράμμα (*gramma*) = that which is drawn or written, a letter: γράφω (*graphō*) = to grave, to write.]

† 1. The letters of any word read backwards. Thus in a satire on the Whig government under Lord Melbourne, which appeared in a provincial Tory paper, the political leader was described as Enruoblem, which was simply Melbourne spelled backwards.

2. The letters of any word or words transposed in their order so as to make another word, or more generally a short sentence. Thus the letters in the name of *William Noy*, Attorney-General to Charles I., who toiled hard in his vocation, become, when transposed, *I moyl in law.* Similarly *Galen* becomes by transposition *angel*, and *Mary, army.* The practice was not much in vogue among the Greeks and Romans, but it was common among the Jewish cabalists. Among European nations it first began to be extensively employed in the sixteenth century. Sometimes writers put not their own name but its anagram on their works; thus, Calvin put not Calvinus, but its anagram, Alcuinus, on the edition of his *Institutes* published at Strasburg in 1539. In certain cases mathematicians who had made discoveries for which they wished to claim priority without communicating their secret, gave forth its anagram instead of itself. This was done by Galileo, Huyghens, and Sir Isaac Newton. Sometimes these anagrams were intentionally so obscurely worded, and of such a length, as to render their solution almost impossible. Thus Galileo announced his observations on Saturn:—Smaismrmilme poeta leumi bone nugttaviras = *altissimum planetam tergeminum observavi* (I have observed that the most distant planet is triple-formed). Huyghens also announced his discovery of Saturn's ring in the following anagram:—aaaaaaa ccccc d eeeee iiiiiii llll mm nnnnnnnnn oooo pp q rr s ttttt uuuuu = *annulo cingitur, tenui, plano nusquam cohærente, ad eclipticam inclinato* (it is surrounded by a slender ring, nowhere coherent, inclined to the ecliptic).

"Though all her parts be not in th' usual place,
She hath yet the *anagrams* of a good face;
If we might put the letters but one way,
In that lean dearth of words, what could we say?"
Donne's Poems, p. 70.

In keen iambicks, but mild *anagram.*"

B. *Technically:*

I. *Logic:*

1. Resemblance of relations, a meaning given to the word first by the mathematicians, and adopted by Ferguson, Whately, and, as one of various senses, by John Stuart Mill. To call a country like England, which has sent out various colonies, the mother country, implies that there is an analogy between the relation in which it stands to its colonies and that which a mother holds to her children. (Mill's *Logic.* (See B., II., *Math.*)

2. *More usually:* Resemblance of any kind on which an argument falling short of induction may be founded. Under this meaning the element of relation is not specially distinguished from others. "Analogical reasoning, in this second sense, may be reduced to the following formula: Two things resemble each other in one or more respects; a certain proposition is true of the one, therefore it is true of the other." If an invariable conjunction is made out between a property in the one case and a property in the other, the argument rises above analogy, and becomes an induction on a limited basis; but if no such conjunction has been made out, then the argument is one of analogy merely. According to the number of qualities in one body which agree with those in another, may it be reasoned with confidence that the as yet unexamined qualities of the two bodies will also be found to correspond. (Mill's *Logic*, pp. 98—107.) Metaphor and allegory address the imagination, whilst analogy appeals to the reason. The former are founded on similarity of appearances, of effects, or of incidental circumstances; the latter is built up on more essential resemblances, which afford a proper basis for reasoning.

II. *Math.:* Proportion; the similitude of ratios. (Euclid, Bk. V., Def. 8.)

III. *Grammar:* Conformity with the structure or the genius of a language.

IV. *Biol.:* The relation between parts which agree in function, as the wing of a bird and that of a butterfly, the tail of a whale and that of a fish. (Huxley's *Classif. of Animals*, 1869, Gloss.) Relations of analogy were made very prominent in the system of the now extinct Quinary School of zoologists. They are to be carefully distinguished from those of affinity. [Affinity.]

"The *analogy* between the swan and the ostrich is one degree, that between the ostrich and the giraffe is another, while the *analogy* between the bee and the weaving birds (Ploceanæ) is another."—*Ibid.*

† ăn′-ą-lўş-ą-ble, *a.* [Analyzable.]

† ăn′-ą-lўşe, *v.t.* [Analyze.]

ăn′-ą-lўş-ĕr, *s.* [Analyzer.]

ąn-ăl′-ўs-ĭs, *s.* [In Sw. *analys*; Dan. *analysis*; Ger. *analyse* (*Logic*), *analysis* (*Math.*); Fr. & Port. *analyse*; Sp. *analisis*; Ital. *analisi.* From Gr. ἀνάλυσις (*analusis*) = (1) a loosing, releasing; (2) a dissolving, the resolution of a whole into its parts, *analysis* opposed to *genesis* or *synthesis*; in Logic, the reduction of the imperfect figures into the perfect one; (3) the solution of a problem, &c.: ἀνάλύω (*analuō*) = to unloose: ἀνά (*ana*) = backward, and λύω (*luō*) = to loose.]

A. *Ordinary Language:*

1. *Gen.:* The act of analysing; the state of being analysed; the result of such investigation. The separation of anything physical, mental, or a mere conception into its constituent elements. (A scientific word which

has partially established itself in ordinary speech.) [ANALYZE, *s.*]

"We cannot know any thing of nature, but by an *analysis* of its true initial causes; till we know the first springs of natural motions, we are still but ignorants."—*Glanville.*

Used specially—

(1.) In some of the senses given under B. (q.v.).

". . . but the subsequent translation of the shock of the æthereal waves into consciousness eludes the *analysis* of science."—*Tyndall: Frag. of Science* (3rd ed.), viii., p. 177.

(2.) A syllabus, conspectus, or exhibition of the heads of a discourse; a synopsis, a brief abstract of a subject to enable a reader more readily to comprehend it when it is treated at length. Thus Lindley, in his *Vegetable Kingdom*, presents a conspectus of the several orders of plants under the heading "Artificial Analysis of the Natural Orders."

B. *Technically:*

I. *Math.:* The term *analysis*, signifying an unloosing, as contradistinguished from *synthesis* = a putting together, was first employed by the old Greek geometricians to characterise one of the two processes of investigation which they pursued. The *Analytical Method* of inquiry has been defined as the art or method of finding out the truth of a proposition by first supposing the thing done, and then reasoning back step by step till one arrives at some admitted truth. It is called also the *Method of Invention* or *Resolution*. Analysis in Mathematics may be exercised on finite or on infinite magnitudes or numbers. The analysis of finite quantities is the same as *Specious arithmetic* or *algebra*. That of infinites, called also the *new analysis*, is particularly used in fluxions or the differential calculus. But analysis could be employed also in geometry, though Euclid preferred to make his immortal work synthetic; it is therefore a departure from correct language to use the word *analysis*, as many on the Continent do, as the antithesis of geometry; it is opposed, as already mentioned, to synthesis, and to that alone.

"Calculations of this nature require a very high *analysis* for their successful performance, such as is far beyond the scope and object of this work to attempt."—*Herschel: Astron.*, 8th ed. (1858), § 604.

II. *Chem.:* The examination of bodies with the view of ascertaining of what substances they are composed, and in what proportion these substances are contained in them. The former is called *qualitative* and the latter *quantitative* analysis.

"The following method may be adopted for this kind of *quantitative analysis*."—*Todd & Bowman: Physiol. Anat.*, vol. ii., p. 308.

Chemical analysis is classified into *Blowpipe*, *Qualitative*, *Gravimetrical*, and *Volumetric* analysis; and the *Proximate* and the *Ultimate* analysis of organic bodies.

1. *Blowpipe Analysis:* The substances examined by the blowpipe are (1) heated alone on charcoal; (2) heated on a platinum wire with borax (q.v.); (3) with microcosmic salt, $NaH.(NH_4)PO_4+4H_2O$; (4) with sodium carbonate; (5) on a piece of charcoal which has been moistened with a few drops of nitrate of cobalt; (6) fused with potassium nitrate. The reactions are given under the respective metals (q.v.). (Consult Plattner on the Blowpipe.)

2. *Qualitative Analysis* is employed to find out the composition and properties of any unknown substance, and to separate different substances from each other. It is performed in the following manner:—The substance is dissolved in distilled water; if not soluble in water, then in hydrochloric acid or in aquaregia; if insoluble in these, it is fused with sodium carbonate. The commoner bases and acids contained in the solution are tested for as follows:—

Add hydrochloric acid. A *white precipitate* is either AgCl (argentic chloride), Hg_2Cl_2 (mercurous chloride), or $PbCl_2$ (plumbic chloride).

Filter; pass H_2S (sulphuretted hydrogen gas) through the filtrate. A *black precipitate* is either PbS (plumbic sulphide), CuS (cupric sulphide), HgS (mercuric sulphide), or Bi_2S_3 (sulphide of bismuth). A *yellow precipitate* is either CdS (cadmium sulphide), As_2S_3 or As_2S_5 (sulphides of arsenic), or SnS_2 (stannic sulphide). A *brown precipitate* is SnS (stannous sulphide). An *orange precipitate* is Sb_2S_3 (antimonic sulphide).

Filter; boil the filtrate to expel H_2S, add a few drops of nitric acid, and boil to oxidise the iron; then add chloride of ammonium and ammonia. A *red precipitate* is Fe_2O_3 (ferric oxide). A *bluish-green precipitate* is Cr_2O_3 (chromic oxide). A *white precipitate* is Al_2O_3 (aluminic oxide), or phosphates, borates, and oxalates.

Filter; to the filtrate add sulphide of ammonium. A *black precipitate* is either CoS (sulphide of cobalt), or NiS (sulphide of nickel). A *pink precipitate* turning *brown* is MnS (sulphide of manganese). A *white precipitate* is ZnS (sulphide of zinc).

Filter; to the filtrate add ammonium carbonate. A *white precipitate* is either $BaCO_3$, $SrCO_3$ or $CaCO_3$ (carbonates of barium, strontium, or calcium).

Filter; divide the filtrate into two parts. To one part add $Na_2H.PO_4$ (sodium phosphate). A *white precipitate* is $Mg(NH_4)PO_4+6H_2O$, indicating the presence of magnesia. The other part is evaporated to dryness, heated strongly to drive off the ammoniacal salts, and if there is a residue it is tested for potash and soda.

Ammoniacal salts are tested for in the original solution by adding caustic potash, which liberates ammonia, NH_3, which is recognised by its smell, and by its turning red litmus paper blue.

The sulphides of arsenic, antimony, and tin are soluble in sulphide of ammonium, and are re-precipitated by HCl.

The tests for the other rarer metals and acids, and the confirmatory tests for the above, are given under their respective names (q.v.).

Acids may be tested for as follows:—Carbonic, hydrosulphuric, hydrocyanic acids are liberated by stronger acids with effervescence. Carbonic, arsenious, arsenic, chromic, boracic, phosphoric, oxalic, hydrofluoric, and silicic acids give from a neutral solution a *white precipitate*, with $BaCl_2$ (barium chloride), which dissolves in hydrochloric acid; but sulphuric acid gives a *white precipitate* insoluble in acids.

Tartaric and citric acids are recognised by the precipitate charring when heated, and emitting fumes of peculiar odour.

Chloride of calcium, with phosphoric and boracic acids, gives a *white precipitate*, which is soluble in acetic acid; also with oxalic and hydrofluoric acids, a *white precipitate*, insoluble in acetic acid.

Nitrate of silver ($AgNO_3$) gives a *black precipitate* with hydrosulphuric acid, a *yellow precipitate* with arsenious, phosphoric, and silicic acid; a *red precipitate* with chromic and arsenic acid; and a *white precipitate* with boracic and oxalic acids. All these precipitates are soluble in nitric acid.

Nitrate of silver ($AgNO_3$) gives a precipitate insoluble in nitric acid with hydrochloric, hydrocyanic, hydrobromic, and hydriodic acids.

Ferric chloride (Fe_2Cl_6) gives a *red colour* with acetic acid and sulphocyanic acid; a *black precipitate* with gallic and tannic acids; a *blue precipitate* with ferrocyanides.

Nitric acid (HNO_3) and chloric acid ($HClO_3$) are not precipitated by any reagent. Their salts deflagrate on ignited charcoal.

For confirmatory tests for acids, see under their respective names. (See Fresenius', Galloway's, or Will's *Qualitative Analysis.*)

3. *Gravimetrical Analysis*, or quantitative analysis by weight, is the method of separating out of a weighed quantity of a compound its constituents, either in a pure state or in the form of some new substance of known composition, and accurately weighing the products; from the results of these operations the percentage of the constituents contained in the substance can be determined. (For methods see Fresenius' *Quantitative Analysis.*)

4. *Volumetrical Analysis*, or quantitative analysis by measure, determines the amount of the constituents contained in a given solution by—

(*a*) Neutralisation of a measured quantity of the liquid by a certain volume of a standard solution of acid or alkali.

(*b*) By the quantity of a standard solution of an oxidising or reducing agent required to oxidise or reduce a measured quantity of the liquid to be tested.

(*c*) By observing when no further precipitation takes place on adding the standard solution of the reagent to a known volume of the liquid to be tested. (See Sutton's *Volumetric Analysis* and Mohr's *Titrirmethode.*)

5. By *Proximate Analysis* we determine the amount of sugar, fat, resin, alkaloid, &c., contained in an organic compound, each of these being removed and separated by different solvents, &c.

6. By *Ultimate Analysis* of an organic substance we determine the percentage of carbon, hydrogen, oxygen, nitrogen, sulphur, and phosphorus contained in it. Thus the amount of carbon and hydrogen is determined by burning a weighed quantity of the substance in a combustion tube along with oxide of copper, and collecting the water produced in a weighed U tube filled with chloride of calcium, and the carbonic acid gas in weighed bulbs filled with caustic potash. (See Fresenius' *Quantitative Analysis.*)

III. *Other sciences, Logic, Metaphysics, Philology, &c.:* The separation of anything which becomes the object of scientific inquiry into its constituent elements; also the result thus obtained.

Prosody: A foot consisting of three syllables: the first two short, and the third long. It may, from one point of view, be considered the reverse of a dactyl, which has the first syllable long, and the second and third short. In Latin, *Hĕlĕnē* is an anapest. In English it is difficult to find single words, each constituting an anapest; the tendency in our language being to pronounce trisyllables as dactyls. *Overflow* and various other words beginning with *over* may be made anapæsts; thus, *ō | vĕr | flōw, ō | vĕr | rēach,* though they might also be made amphimacers, *ō | vĕr | flōw, ō | vĕr | rēach.* The following is an anapæstic line:—

In our latitudes it attains the length of six or seven feet. It has a cat-like head, wolf-like voracity, and a by no means prepossessing appearance.

The dropsical effusion which often appears in children after scarlatina, and that which after heart disease in old age creeps up from the lower limbs till it terminates life, with other dropsical effusions, are all ranked under anasarca. anastatic printing, *s.* A method of zincography invented by Wood in 1841, designed to reproduce drawings, engravings, printed matter, &c., whether recent or old. If, for instance, it be sought to obtain the *fac-simile* of an old newspaper, the paper is first wetted with dilute phosphoric acid, and then placed between sheets of blotting paper to remove the superfluous moisture. It is then found that the acid has corroded the blanks, but has not affected the printed letters. The sheet is next placed in contact with a plate, and pressure applied, which makes a *fac-simile* of the letters in reverse order on the plate. Gum is next applied, and more ink, then a little acid, and finally again ink, when the printing stands out as clear and distinct as in the original.

ăn-ą-stăt'-ĭ-cą, *s.* [Gr. *ἀνάστατος* (*anastatos*) = made to stand up; from *ἀνάστασις* (*anastasis*) (q.v.).] A genus of plants belonging to the order Brassicaceæ, or Crucifers. The *A. hierochuntina* is the celebrated "Rose of Jericho." It is an annual, inhabiting the Egyptian desert. It is so highly hygrometric that when fully developed it contracts its rigid branches so as to constitute a ball. Exposed then to the action of the wind, it is driven hither and thither. If, however, it be brought in contact with water, the ball-form vanishes, and the branches again acquire their natural expansion. Superstitious tales about this so-called rose are afloat in the East. It is said to have first bloomed on Christmas Eve, and continued in flower till Easter: at its birth heralding the advent of the Redeemer, and immediately before its departure honouring his resurrection. It is almost unnecessary to add, that for these fancies there is no foundation whatever in fact. (*Gardener's Chronicle*, 1842, p. 363. *Lindley: Veg. Kingd.*, 1847, p. 354.)

ăn-ą-stŏm-ăt'-ĭc, *a. & s.* [Gr. *ἀνά* (*ana*) = through, and *στόμα* (*stoma*) = the mouth.]

1. A uniting by the mouths of vessels distinct during the greater part of their course. (Used especially of the veins and arteries in the human or animal body, and of the veins in plants.)

"One of the most simple of these *anastomoses* is found in the union of two arteries, originating from different trunks to form one."—*Todd & Bowman: Physiol. Anat.*, vol. ii., p. 323.

2. An interlacing, as of any branched system; a network.

"The *anastomosis* of nerves thus formed differs from the more correctly named *anastomisis* of blood-vessels; for in the latter case the canals of the anastomosing vessels communicate, and their contents are mingled; but in the former the nerve-tubes simply lie in juxtaposition, without any coalescence of their walls, or any admixture of the material contained within them."—*Todd & Bowman: Physiol. Anat.*, vol. ii., p. 218.

Both in Latin became *anathēma.* In Greek the first signified a votive offering set up in a temple to be preserved; the second, ultimately at least, a similar offering devoted to destruction. It is from the latter that the English word *anathema* comes. Both are from *ἀνατίθημι* (*anatithēmi*) = to lay upon, to set up as a votive gift; *ἀνά* (*ana*) = up, and *τίθημι* (*tithēmi*) = to put, to place.]

II. *Church History:*

1. Excommunication and denunciation by a pope, a council, or a bishop, of a real or reputed offender. This was called the *judiciary* anathema. Scott thus describes it:—

" At length, resolved in tone and brow,
Sternly he question'd him—'And thou,
Unhappy! what hast thou to plead,
Why I denounce not on thy deed
That awful doom which canons tell
Shuts paradise and opens hell;
Anathema of power so dread,
It blends the living with the dead,
Bids each good angel soar away,
And every ill one claim his prey;
Expels thee from the church's care,
And deafens Heaven against thy prayer;
Arms every hand against thy life,
Bans all who aid thee in the strife—
Nay, each whose succour, cold and scant,
With meanest alms relieves thy want;
Haunts thee while living,—and, when dead,
Dwells on thy yet devoted head,
Rends Honour's scutcheon from thy hearse,
Stills o'er thy bier the holy verse,
And spurns thy corpse from hallow'd ground.
Flung like vile carrion to the hound;
Such is the dire and desperate doom
For sacrilege, decreed by Rome.'"
Scott: Lord of the Isles, ii. 28.

". . . the researches of the *morbid anatomist*."—*Todd & Bowman: Physiol. Anat.*, i. 316.

¶ The chief names in antiquity which have come down to our time as anatomists are those of the second Hippocrates, who was born B.C. 460, and died about 377; Aristotle, who made his chief anatomical investigations between B.C. 334 and 327; Herophilus and Erasistratus of Alexandria, in the third century B.C. (?); Celsus, A.D. 3 to 5 (?); and the most illustrious, in this respect, of all, Galen of Pergamus, who was born in A.D. 131, and died about the beginning of the third century. In modern times the revival of anatomical study began in Italy, and quite a crowd of illustrious inquirers flourished in that country before much was done in this department of science in the other parts of Europe. The first was Mondini of Bologna, who flourished about A.D. 1315. Of the rest may be mentioned Eustachi, about 1495 or 1500, after whom a tube in the ear is called, and a valvular membrane in the heart [Eustachian]; Fallopio, or Fallopius, who was born about 1523, and died in 1562, and who gave a name to the Fallopian tubes of the uterus; Cæsalpini, after whom the Cæsalpinia genus of plants is called; and finally, Malpighi, born in 1628, and died 1694, after whom the Malpighia genus of plants and a gland are named. Of the early English anatomists, the most illustrious was Harvey, who was born in 1578, published his immortal work, in which the circulation of the blood is intimated, in 1628, and died in 1657. The later anatomists who have rendered good service to the science are too numerous to be mentioned here.

2. Mentally to dissect or separate into minute portions, with the view of thoroughly understanding it, any object presented to the senses, or any idea suggested to the mind.

A. *Ordinary Language:*

I. *Literally:*

1. The act or process of dissecting the body of a man or an animal, with the view of ascertaining its internal organization, its development, and the changes which its structures undergo in disease. The act or process of similarly treating a plant. (In this first sense anatomy is an art.)

2. The knowledge of the internal structure of human or animal bodies, or of plants, acquired by such dissections. (In this second sense anatomy is a science.)

II. *Figuratively:*

1. A skeleton.

"Oh that my tongue were in the thunder's mouth,
Then with a passion I would shake the world,
And rouse from sleep that fell *anatomy*,
Which cannot hear a feeble lady's voice."
Shakesp.: K. John, iii. 4.

2. The body.

". . . Oh, tell me, friar, tell me,
In what vile part of this *anatomy*
Doth my name lodge? tell me, that I may sack
The hateful mansion."
Shakesp.: Romeo and Juliet, iii. 3.

3. *In ridicule:* A thin, meagre-looking person.

"They brought one Pinch, a hungry lean-faced villain,
A mere *anatomy*, a mountebank,
A threadbare juggler, and a fortune-teller,
A needy, hollow-ey'd sharp-looking wretch,
A living dead man."—*Shakesp.: Com. of Errors*, v. 1.

4. Such elaborate division and subdivision of anything as remind one of dissections by an anatomist.

"It is therefore in the *anatomy* of the mind as in that of the body: more good will accrue to mankind by attending to the large, open, and perceptible parts, than by studying too much such finer nerves and vessels as will for ever escape our observation."—*Pope.*

B. *Technically:*

I. *Science:* The knowledge of the structure of organised bodies obtained by their dissection. (See A., I. 1, 2.) It is naturally divided into (1) Animal Anatomy, generally called by way of eminence simply *Anatomy*, and (2) Vegetable Anatomy.

1. *Animal Anatomy.* To this the name of Zootomy is sometimes applied. It is naturally subdivided into (*a*) Human and (*b*) Comparative Anatomy.

(*a*) *Human Anatomy, or the anatomy of the human subject.* It is sometimes called Anthropotomy (q.v.). The prejudice against allowing the body of a relative, or even a corpse of any kind, to be dissected, long retarded the progress of this highly important and useful department of human knowledge, the ancients, and many moderns too, being obliged to limit their dissections to the dead bodies of the lower animals, drawing analogies thence to the human frame instead of directly studying the corpses of mankind. Happily this difficulty has now been in large measure overcome in all civilised countries. Human anatomy is generally divided into three subdivisions, *Descriptive, General*, and *Pathological* or *Morbid Anatomy.* The first investigates the various organs of the human body as they are in health, and the third as they are in disease; whilst the second inquires into the tissues, structures, or characteristics which are common to several organs. Sometimes *Descriptive* Anatomy, as distinguished from that which is *General*, is called *Particular* or *Special.* Sometimes, again, a new category is added, *Surgical Anatomy*, which treats of the position of the several organs with the view to possible surgical operations.

(*b*) *Comparative Anatomy:* The science which compares the structure of man with that of the inferior animals, and also that of the several classes, orders, &c., of the animal kingdom among each other, to ascertain the resemblances and dissimilarities in their analogous structures and organs. The knowledge thus acquired is then used for purposes of classification and for the study of development. This is the science of Cuvier, Owen, and Huxley.

"There is no just ground to fear that the time required to gain the requisite elementary knowledge of *Comparative Anatomy* will detract from that which ought to have been exclusively occupied in the study of human anatomy and surgery."—*Owen: Lectures on the Comparative Anatomy and Physiology of the Invertebrate Animals* (1843), p. 5.

¶ Akin to Comparative Anatomy are *Physiological Anatomy*, defined by Todd and Bowman (*Anat.*, vol. i., p. 28) as "that kind of anatomy which investigates structure, with a special view to function," &c.; *Transcendental*

Anatomy, which inquires into the plan or model on which the animal structure and its several parts have been framed.

2. *Vegetable Anatomy:* The similar dissection of a plant, or any part of it, to ascertain its structure. It is sometimes called also Phytotomy (q.v.).

". . . little was known of vegetable physiology, nothing of *vegetable anatomy*."—*Lindley: Introd. to Bot.* (3rd ed., 1839), Pref.

II. *Art:*

1. The art described under A., I. 1 (q.v.).

2. *Artificial anatomy:* The art of making models in wax, or some similar material, of the several parts of the frame in health and disease.

Examples: the almond, the apple, the ranunculus, &c. (*Lindley: Introd. to Bot.*)

It is translucent, is of greenish-white colour and pearly lustre, and contains about 55·7 parts of silica, a large percentage of alumina, 11·5 of water, a little magnesia, and protoxide of iron. It occurs at Bilin, in Bohemia.

1. A soft wart on a horse's neck.

*2. The disease called "fingers and toes" in turnips. The roots of turnips grown in too wet soil or otherwise unfavourable conditions, rot, and send forth an offensive smell. One of the species most commonly found is the *Trichocera hiemalis*, or Winter Gnat.

It is distinguished from *predecessor*, one who previously held the office to which one has now succeeded.

¶ The Old English term which *ancestors* displaced when it came into the language was *Fore-elders*. (*Barnes: Early Eng.*, p. 104.)

"Regularly at that season several English ships *cast anchor* in the bay."—*Macaulay: Hist. Eng.*, ch. xxiii.

(*b*) *Fig.:* To infix itself firmly in a rock, as a tree does on a mountain side.

B. *Technically:*

1. *Mech. & Naut.:* A well-known instrument for preventing a ship from drifting, by mooring her to the bottom of the sea, provided that the water is shallow enough to permit of this being done. Its invention was at a very early period. Those of the early Greeks were simply large stones, sacks filled with sand, or logs of wood loaded with lead. Then the Tuscans, or Midas king of Phrygia, introduced a tooth, or *fluke*, which was ultimately exchanged for two. The modern anchor consists of a long *bar* or *shank* of iron (*c*), branching out

at the lower extremity into two arms (*b*) ending in flukes (*a*), barbed at their extremity, and with a *stock* of oak or wood (*d*) at the upper one, while it terminates in a ring, to which a rope or chain is affixed. The arms or flukes are designed to penetrate and fix themselves in the sea-bottom. They consist of a *blade*, a *palm*, and a *bill*. The one end of the shank is made square to receive and hold the stock steadily in its place without turning. To keep the stock also from shifting along the shank, there are raised on it from the solid iron, or welded on it, two square tenon-like projections, called *nuts*. The end of the shank next the stock is called the *small round*. The other extremity, where the arms and the shank unite, is called the *crown*; and the points of the angle between the arms and the shank,

the *throat*. A distance equal to that between the throat of one arm and its bill [Bill] is marked on the shank from the place where it joins the arms, and is called the *trend*. The use of the shank is to present an attachment for the cable. [Cable, Shackle, Ganger.] That of the stock is to make the anchor fall in such a way as to enable one of the flukes easily to infix itself in the ground. Large vessels have more anchors than one, which are stowed in different parts of the ship. The *best bower* to the starboard, the *small bower* [Bower] to the port-cathead, with the flukes on the bill-board, the *sheet anchor* on the after part of the fore-channels on the starboard side, and the *spare anchor* on the port side. [For other anchors, see Stream, Kedge, Grapnel, Mushroom, Floating, Mooring.]

2. *Naut.* Some technical phrases which have found their way into English literature have already been given. [A. 1.] Others are the following:—

An anchor is said to *come home* when it is wrenched out of the ground and dragged forward by the violence of the wind or the sea, or by the strength of a current. It is *foul* if it become entangled with the cable; *a-wash*, when the stock is hove up to the surface of the water; *a-peak*, when the cable is so drawn as to bring the ship directly over it; *a-cockbill* [A-cockbill], when hanging vertically; *a-tip*, when drawn out of the ground in a perpendicular direction; and *a-weigh*, when it has been drawn just out of the ground and hangs vertically.

At anchor is the same as *anchored*.

To back an anchor is to lay down a small anchor a-head of the one by which the ship rides, with the cable fastened to the crown of the principal one to aid in preventing its "coming home."

To cat the anchor: To draw the anchor to the cathead by means of a machine called the "cat."

To fish the anchor: To employ a machine called a "fish" to hoist the flukes of an anchor to the top of the bow.

To steer the ship to her anchor: To steer the ship to the spot where the anchor lies while the cable is being heaved on board the ship.

To shoe the anchor: To cover the flukes of it with a triangular plank of wood to enable it to fix itself more tenaciously in a soft bottom.

To sweep the anchor: To dredge at the bottom of the anchoring ground for a lost anchor.

To throw the anchor. The same as *Cast the anchor* (A. 1).

1. *Church History:* Any person who, from religious motives, has renounced the world, and retired from it into seclusion. (For the distinctions between the various kind of Ascetics, see that word. See also Eremites.) The peculiarity of the anchorites, properly so called, was, that though they had retired for solitude to the wilderness, yet they lived there in fixed abodes (generally caves or hovels) in place of wandering about. When they did travel they slept wherever night overtook them, so that visitors might not know where to find them. They were most numerous in the Egyptian desert, where they lived on roots and plants, believing that to afflict the body was the best method of spiritually benefiting the soul. Most of them were laymen; there were also female anchorites. They first arose, it is said, about the middle of the third century, and in the seventh the Church extended its control over them, and ultimately threw difficulties in the way of any one who wished to adopt such a mode of life. [Ascetic, Eremite, Monasticism, Monk, &c.] (*Mosheim: Church Hist.*, Cent. iv., pt. ii., ch. iii., § 15.)

2. *In a general sense:* Any person of similar habits to those of the old anchorites now described. The mistaken desire to retreat from the "world" to the wilderness is not distinctively Christian: it tends to manifest itself to a greater or less extent in all religions and in all ages. Anchorites of various Hindu ascetic sects are at present to be found among the jungles and hills of India, and they were much more numerous when the dominant faith in that land was Booddhism.

"To desperation turn my trust and hope!
An *anchor's* cheer in prison be my scope."
Shakesp.: Hamlet, iii. 2

"Yet lies not love dead here, but here doth sit,
Vow'd to this trench, like an *anchorite.*"
Donne.

It belongs to the Clupeidæ, or Herring family. In general, its length is from four to five inches; but specimens have been found seven and a-half inches

ANCHOVY (ENGRAULIS ENCRASICOLUS).

long. It is common in the Mediterranean and parts of the ocean. It occurs also, though not very commonly, on the shores of Britain. Shoals of anchovies annually enter the Mediterranean, and various fisheries exist along its northern shores, the most celebrated being at Gorgona, a small island west of Leghorn. Sometimes another species, the *E. meletta*, is either mixed with, or substituted for the genuine fish. There is a large importation of anchovies into London.

anchovy-pear, *s.* The English name of the genus Grias, which is placed by Lindley doubtfully under the order Barringtoniaceæ (Barringtoniads). *Grias cauliflora*, the stem-flowering anchovy-pear, is an elegant tree, with large leaves, which grows in the West Indies. The fruit, which is eaten, tastes like that of the mango, and is pickled in the same way.

anchovy-sauce, *s.* A sauce made of the fish called anchovy.

ăn-chū′-sa, *s.* [In Ital. *ancusa*; Sp. & Lat. *anchusa*. From Gr. ἄγχουσα (*angchousa*) = alkanet; ἄγχω (*angchō*) = to press tight, to strangle; so called from a ridiculous notion entertained by Dioscorides that one might kill a viper if he irritated its throat by spitting into its mouth after having chewed the leaves of alkanet.] A genus of plants belonging to the order Boraginaceæ (Borage-worts). Two species are generally inserted in the British flora, but both are doubtfully native. They are the *A. officinalis*, the Common, and the *A. sempervirens*, the Evergreen Alkanet. *Lycopsis arvensis* is sometimes called *Anchusa arvensis*. The real alkanet, once termed *Anchusa tinctoria*, now figures as *Alkanna tinctoria*. [Alkanna, Alkanet.] A beautiful species, sometimes cultivated in flower-borders, is *Anchusa paniculata* or *Italica*.

Anat.: The coalescence of two bones, so as to prevent motion between them. If anything keep a joint motionless for a long time, the bones which constitute it have a tendency to become anchylosed, in which case all flexibility is lost. In other cases, when anchylosis is the lesser of two evils, the bones which nature is about to weld together should be kept in the positions in which they will be of the greatest use when the union between them takes place.

"Had immobility been the object to be attained, that might have been more effectually accomplished by the fusion of the extremities of the segments together, as in *anchylosis*."—*Todd & Bowman: Physiol. Anat.*, vol. i., p. 133.

2. Old, estimated by the average duration of that to which the term *ancient* is applied.

". . . some far-spreading wood

3. Old, estimated by the historic standard of time.

(*a*) Opposed to modern, and especially referring, at the present day, to the centuries anterior to the fall of the Roman Empire. (In this sense, which is the most common use of the word, it is opposed to *modern.*)

"The whole history of *ancient* and of modern times records no other such triumph of statesmanship."—*Macaulay: Hist. Eng.*, ch. ix.

(*b*) In the mouth of one who lived at an early period of the world's history, it meant an age prior to his own.

4. Old, estimated by the geological standard of duration.

"Processes now going on in nature on a small scale, or imitated artificially by man, may enable us to comprehend imperfectly in what manner some of these infinitely grander *ancient* metamorphoses were effected."—*Murchison: Siluria*, ch. i.

5. From eternity.

"Thales affirms that God comprehended all things, and that God was of all things the most *ancient*, because he never had any beginning."—*Raleigh.*

¶ The words *ancient* and *old* are akin in meaning, and it is not easy to draw an absolutely precise line between their respective significations. *Old*, being opposed to *new*, is especially used of anything which is fresh when new, but has a tendency to wear out when old, or has nearly reached its proper term of existence, as an *old* hat; but it is also used when the lapse of time has increased instead of diminished the value of an article, as *old* wine. So also we speak of the *old* masters, meaning those who lived long ago, not those who are advanced in years. Finally, *old* generally indicates a lesser amount of duration than *ancient.* [Old.]

*2. A predecessor in anything.

"He toucheth it as a special pre-eminence of Junias and Andronicus, that in Christianity they were his *ancients*."—*Hooker.*

¶ The reference is to Paul's statement, "Andronicus and Junia, my kinsmen and my fellow-prisoners, . . . who also were in Christ before me." (Rom. xvi. 7.)

3. (*Plur.*) Those who lived long ago. To us in general this means before the fall of the Roman empire, the relapse into semi-barbarism which followed its overthrow making a great gap in time between the civilisation of what may be called the old world and that now existing. In this sense, *ancients* is opposed to *moderns.* This is the common use of the word. Sir G. Cornewall Lewis employs it thus in the title of his book, *The Astronomy of the Ancients.*

"Some by old words to fame have made pretence,
Ancients in phrase, mere moderns in their sense.'
Pope: Essay on Criticism, 324, 325.

¶ To those who lived in the early ages of the world, of course the term signified men of a considerably prior date.

ănd'-a, *s.* [? Native name.]

Bot.: A genus of plants belonging to the order Euphorbiaceæ (Spurge-worts). Habitat, Brazil. The Anda is remarkable for the purgative properties of its seeds, in this respect resembling the not remotely allied plant, the well-known castor-oil. The Brazilians use them in indigestion, liver-complaints, jaundice, and dropsy. They are called Purga da Paulistas. Their rind roasted on the fire is used in diarrhœa brought on by cold. If steeped when fresh in water, they render the liquid so narcotic that it is sufficient to stupefy fish. The oil is well adapted for the purposes of the painter. The fruit is eatable. (*Lindley: Nat. Syst. of Bot.*, 1836, p. 114.)

Its sp. gr. 3·1 to 3·2, 3·05 to 3·35; its lustre vitreous; its colour whitish-red, flesh-red, violet, pearl-gray, reddish-brown, or olive-green. There is strong double refraction. The composition is silica, 33 to 40·17; alumina, 50·96 to 61·9; sesquioxide of iron, 0·30 to 5·71; sesquioxide of manganese, 0·53 to 0·83; magnesia, 0·17 to 1·14; lime, 0·21 to 4·12; soda, 0·10; potassa, 0·30 to 1·50; water, 0·25 to 2·60. Dana divides andalusite into "Var. 1, Ordinary; 2, Chiastolite (macle)." Andalusite is found in argillaceous schist, in gneiss, in mica-schist, and rarely in serpentine. It is sometimes allied to kaolin, to mica, or to cyanite. It occurs at Andalusia in Spain, in Germany, Austria, France, and Russia; at Killincy Bay, near Dublin, in Ireland; near Ballachulish, in Scotland; and at Cumberland in England. Mycelin has the composition of cyanite and andalusite.

ănd'-ē-şīte, *s.* [In Ger. *andesin.* From the Andes mountains, in which it occurs.] A triclinic mineral classed by Dana in his thirteenth, or Felspar group of Unisilicates. The hardness is 5—6; the sp. gr. 2·61 to 2·74; the colour white, gray, greenish, yellowish, or flesh red; the lustre sub-vitreous, inclining to pearly. [ANDESYTE.]

ăn-dē-sȳte, *s.* [From *andesite*, but with *yte* in place of *ite*, to show that it is a rock, and not a mineral.] A syenite-like rock occurring in the Andes. One of its ingredients is the mineral Andesite (q.v.).

The fruit is one-seeded, drupaceous, and in aspect like a plum. *A. inermis* is the cabbage-tree of the West Indies. [CABBAGE-TREE.] Its bark and that of *A. retusa* are anthelmintic. ănd′-ĭr-ŏn, hănd′-ĭr-ŏn, * âwnd′-ĭr-ŏn, * âwynd′-ȳrne, * âwynd′-ĕr, *s.* [In A.S. *brand-isen* is = a branding-iron or rod, a tripod (*Bosworth*), but this does not seem the origin of the English word. Sw. *brandjern*; Fr. & Arm. *landier*; Mediæv. Lat. *andena* = an andiron. Skinner derives it (*a*) from *hand* and *irons*, or (*b*) from *and* and *irons*, or (*c*) from *brand* and *irons*. In Yorkshire the term *end-irons* (see *b*) is applied to two coarse iron plates used to contract the fire-place.

ANDIRONS.

These being movable may be placed at a distance from each other when a large fire is wanted, and nearer when what is needed is only a small one. Boucher thinks that *and* in *andirons* is the A.S. separable prep. *and*, Gr. ἀντί (*anti*), implying opposition, and that and-irons are pieces of iron opposed to each other. Wedgwood believes the true etymology is the Flemish *wend-ijser*, from *wenden* = to turn: andiron would then be the rack in front of the kitchen dogs in which the spit turns.]

Generally in the plural: A pair of and-irons = fire-dogs. A utensil consisting of two upright and generally ornamented pillars at some distance from each other, with a horizontal bar connecting them together. It was originally designed, as it still is in America, to prop up the extremities of logs of wood whilst they were being burnt. Then it was used to support the ends of a spit.

"... Her *andirons*
(I had forgot them) were two winking Cupids."
Shakesp.: Cymbeline, ii. 4.

Anemometers have been made of three kinds: 1st, those in which a windmill twists string round an axle against pressure; 2nd, those in which a defined surface, say of a foot square, is pressed against a spring (Fig. 1); 3rd, those in which water or some other liquid is made to stand at a higher level in one leg of an inverted siphon than in the other (Fig. 2). The anemometer now most commonly in use is more akin to the first, which also was the earliest type of the instrument, than it is to the second or the third. Four light metallic hemispheres, called from Dr. Robinson, who first employed them, Robinson's cups (Fig. 3), are made to revolve like a vane or weather-cock, and are found to do so at the rate of exactly one-third the velocity of the wind. The result is then recorded in pencil marks by a self-registering apparatus.

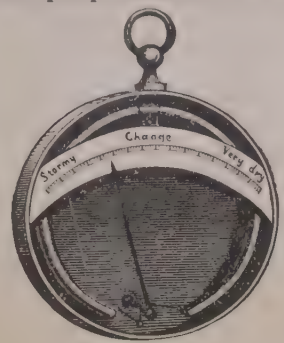
A. *As adjective:* Not containing any liquid. (Used chiefly in the expression, "Aneroid barometer.)

Aneroid Barometer: A barometer not containing a liquid, but constructed on a totally different principle from a mercurial barometer.



ANEROID BAROMETER.

Various forms of the instrument exist. One of these consists of a cylindrical metal box exhausted of air, and having its lid of thin corrugated metal. As the pressure increases, the lid, which is highly elastic, and has a spring inside, is forced inwards; whilst, again, as it diminishes, it is forced outwards. Delicate multiplying levers then transmit these motions to an index which moves on a scale, and is graduated empirically by a mercurial barometer. It is wonderfully delicate, but is apt to get out of order, particularly when it has been exposed to great variations of pressure. From its portability it is much used for determining the heights of mountains. (Ganot's *Physics*, 3rd ed., 1868, pp. 130-1.)

ăng'-ĕr, *s.* [A.S. *ange* = straitened, sorrowful, troubled, from Icel. *angr* = grief, sorrow. *Ang* in compos. = trouble. (*a*) In bodily pain.

(*b*) In any other cause. *Spec.*, grief.

And dede hire forge and *anger* mune"
Story of Gen. and Exod. (ed. Morris), 971-72.

2. *Now:* An emotion or passion of the human heart excited by the spectacle of wrong-doing, especially to one's self. When it arises, the heart beats more frequently, the blood circulates more rapidly, the voice becomes loud and menacing, all thought of personal danger passes away, and a desire is felt, if indeed it be not carried out, of punishing the offender. Essentially anger is a virtuous emotion, planted in the breast to intimidate and restrain wrong-doers; but, through human infirmity, it is almost sure to be abused in one of four ways. A person under its influence may be hasty, passionate, fretful, or revengeful.

". . . *anger* is like
A full-hot horse, who being allow'd his way,
Self-mettle tires him."—*Shakesp.: Henry VIII.*, i. 1.

". . . let not thine *anger* burn against thy servant."—*Gen* xliv. 18.

¶ In poetry anger has sometimes, though rarely, a plural. In this case it ceases to be an abstract word, because a concrete one = successive acts or states of indulgence of anger.

angina pectoris, *s.* [Lat. = angina of the breast.] The name first given by Dr. Heberden in 1768, and since then universally adopted as the designation of a very painful disease, called by him also a disorder of the breast; by some others "spasm of the chest," or "heart-stroke," and popularly "breast-pang." It is characterised by intense pain in the præcordial region, attended by a feeling of suffocation and a fearful sense of impending death. These symptoms may continue for a few minutes, half an hour, or even an hour or more. During the paroxysm the pulse is low, with the body cold, and often covered with clammy perspiration. Death does not often result from the first seizure, but the malady tends to return at more or less remote intervals, generally proving fatal at last. There are several varieties of it: an organic and a functional form; and again a pure or idiopathic and a complex or sympathetic one have been recognised. Angina is produced by disease of the heart. It specially attacks elderly persons of plethoric habits, men oftener than women, generally coming on when they are walking, and yet more if they are running up-stairs or exerting great effort on ascending a hill. Stimulants should be administered during the continuance of a paroxysm; but it requires a radical improvement of the general health to produce a permanent effect on the disorder.

ăn′-ǧle (2), *s.* [In Fr. *angle;* Sp. and Port. *angulo;* Ital. *angolo;* from Lat. *angulus* = an angle, a corner; Gr. ἀγκύλος (*angkulos*) = crooked. In Wel. *ongle* is = an angle. Cognate with A.S. *angel, angil* = a hook (see ANGLE, No. 1); Teut. *ang* or *eng* = a narrow strip.]

A. *Ordinary Language:* The opening between two lines which meet one another; a corner, as of a room.

"For, where the rock and wall
Met in an *angle*, hung a tiny roof."
Wordsworth: Excursion, bk. ii.

B. *Technically:* The inclination of two lines to one another.

1. *Geometry.* Angles may be ranked under two leading divisions, *plane* and *solid* angles. A *plane* angle is the inclination of two lines to one another in a plane, which two lines meet together, but are not in the same straight line. [PLANE.] A *solid* angle is that which is made by the meeting in one point of more than two plane angles, which, however, are not in the same plane. [SOLID.] Each of the leading divisions, plane and solid angles, may again be subdivided into *rectilineal, curvilinear,* and *mixed* angles. *A plane rectilineal angle* is the inclination to each other of two straight lines, which meet together, but are not in the same straight line (Fig. 1). A *curvilinear angle* is the inclination to each other of two curved lines, which meet in a point (Fig. 2). *A mixed angle* is one formed by the meeting of a curve and a straight line (Fig. 3).

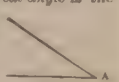

Fig. 1.

Angles are measured by arcs (Fig. 4, M N, P Q), and it is immaterial with what radius the latter are described. The result is generally stated in degrees, minutes, and seconds, ° ′ ″; thus—36° 14′ 23″ = 36 degrees, 14 minutes, and 23 seconds. When an angle is isolated from other angles, it may be named by a single letter, as A (Figs. 1 to 4); but when two or more angles meet at one point they are named by three letters, never by one or two. In such cases the letter at that point is always named in the middle. Thus, in Fig. 5 there are two angles, the first of which may be named indifferently B C A or A C B, but not B A C; and the second D C A or A C D, but not C A D. The point at which the lines forming the angle meet is called the *angular point,* or the *vertex* of the angle, and the lines themselves the *sides* or *legs* of the angle. In Figs. 1, 2, and 3, A is the angular point of the respective angles, the legs or sides being unlettered. In Fig. 5, C is the angular point, and B C, A C, and C D, or C B, C A, and D C are the sides or legs.

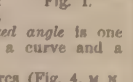

Fig. 2.

Fig. 3.

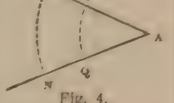

Fig. 4.

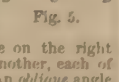

Fig. 5.

Plane rectilineal angles are generally divided into *right* and *oblique,* or into *right, obtuse,* and *acute.* When a straight line standing upon another straight line makes the two adjacent angles (those on the right and left of it) equal to one another, each of them is called a *right angle.* An *oblique* angle is one which is not a right angle. An *obtuse* angle is that which is greater than one right angle, but less than two. An *acute* angle is that which is less than a right angle: both are oblique. The angles marked A in Figs. 1 and 4 are acute angles. In Fig. 5, if A C make the adjacent angles A C B and A C D equal to each other, then each of them is a right angle. In Fig. 6, A C D is an obtuse angle, and A C B an acute angle. Analogous terms exist in the case of curvilinear and mixed angles. Thus, in Figs. 2 and 3, A is an acute angle. *A spherical angle* is one formed by the intersection or the meeting of two great circles of a sphere. Many other designations are applied to angles; thus, in Geometry there are *opposite, exterior, interior, alternate, vertical,* and other angles, also angles of *contact,* &c. (See the italicised words.)

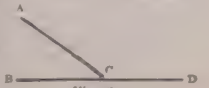

Fig. 6.

2. *Mech.* In this science there are angles of *direction,* of *friction,* of *repose,* &c.

3. *Optics* has angles of *incidence,* of *reflection,* of *refraction,* of *deviation,* of *polarisation,* &c.

4. *Astronomy* has angles of *position,* of *situation,* of *elevation, inclination, depression,* &c. (For these see the italicised words with which *angle* is combined.)

5. *Fortification. Dead Angle:* An angle so formed that a small plot of ground in front of it can neither be seen nor defended from the parapet.

6. *Anatomy.* The *angle of the jaw* is the point at which the vertical hinder edge of the ramus, descending from the condyle, meets the horizontal inferior border. (*Flower: Osteol. of the Mammalia*, 1870, p. 122.)

The caterpillar is green, with a row of oblong white spots on the back, and a continuous white line on each side. It feeds on culinary vegetables and various field plants. The moth is common in England, and is found also in Scotland; it is met with most plentifully in April, June, and September, there being apparently three broods in the season. It has an enormous head, on which are placed two elongated appendages or filaments, the first of them broad and flattened at the end. These, being movable, are manœuvred as if they were bait; and when small fishes approach to examine them, the angler, hidden amid mud and sand, which it has stirred up by means of its pectoral and ventral fins, seizes them at once; hence its name. It occurs along the British coasts, and is three, or occasionally five feet long. (*Yarrell: Brit. Fishes.*)

¶ The Anglo-Saxon tongue did not pass directly into the English. The Norman conquest, as was inevitable, introduced a new element into the language, and produced temporary confusion. When this began to pass away, and it became evident that the tongue of the conquered rather than that of the conquerors was destined ultimately to prevail, it was not the old Anglo-Saxon pure and simple which remained. There came in place of it various dialects, specially a Midland, a Northern, and a Southern one. It was a mixed dialect, mainly Midland, but also slightly Southern, which with Chaucer, in the fourteenth century, became the standard language; and at last, by a series of insensible changes, developed into the modern English tongue. anilic acid, *s.*

Chem.: Indigotic acid = nitrosalicylic acid, $C_7H_7NO_5 = C_7H_5(NO_2)O_3$. Obtained by the action of boiling nitric acid and water on indigo, or on salicylic acid. It crystallises in light yellow needles, soluble in hot water and alcohol.

ăn'-ĭl-ine, *s.* [from *anil* (q.v.)] = **amido-benzene** = **amido-benzol** = **phenyl-amine** =

$$C_6H_7N = \left.\begin{matrix}(C_6H_5)'\\H\\H\end{matrix}\right\}N = C_6H_5(NH_2)'.$$

Chem.: Aniline was first obtained by distilling indigo with caustic potash. It occurs in the heavy oils from coal-tar. It is prepared from benzene, C_6H_6, which is converted into nitrobenzene, $C_6H_5(NO_2)'$, by the action of strong nitric acid. The nitrobenzene is reduced to aniline by the action of acetic acid and iron filings, or by sulphide of ammonium. Aniline is the basis of most of the coal-tar colours. It is an oily, colourless, refractive, volatile liquid, boiling at 182°. Its sp. gr. at 0° is 1·036. It solidifies at −8° to a crystalline mass; when exposed to the air and light, it becomes brown. It is nearly insoluble in water, but dissolves in ether, alcohol, and benzene. It forms crystalline salts with acids. It does not turn red litmus paper blue. A slight trace of aniline gives a deep purple colour with a solution of bleaching powder. Aniline combines with the iodides of alcohol radicals like amines. The atoms of H united to N in aniline can be replaced by alcohol radicals, as ethyl aniline—

$$N\left\{\begin{matrix}C_6H_5\\H\\C_2H_5.\end{matrix}\right.$$

The H in the benzol ring (C_6H_5) can also be replaced by radicals forming substitution compounds of aniline, of which, when one atom of H is replaced by an atom of Cl or a radical, there can be always three modifications: thus, three modifications of nitro-aniline ($C_6H_4)(NO_2)(NH_2)$ are known; also chloraniline, $C_6H_4Cl(NH_2)'$, and bromaniline, $C_6H_4Br(NH_2)$. [See Kekulé's *Organic Chem.*] M. Langorrois has found that the putrefaction and decomposition of animal matter can be prevented, even when it is exposed to the air, and in an elevated temperature, by the use of small quantities of aniline. (*Medical Press and Circular*, quoted in the *Times*, *May* 7, 1873.)

aniline black, *s.* A dye produced by a mixture of aniline, potassium chlorate, and cupric sulphate or a vanadium salt. It is used in calico printing.

aniline orange, *s.* A salt of dinitro-paracresol.

aniline purple, or **mauve,** is prepared by adding to aniline sulphate a dilute solution of potassium bichromate. It contains a base called mauveine, $C_{27}H_{24}N_4$.

aniline violet, *s.* Obtained by heating rosaniline with ethyl iodide, a hydroiodide of triethyl-rosaniline, $C_{20}H_{16}(C_2H_5)_3N_3$.

aniline yellow. [See CHRYSANILINE.]

2. *In contempt:* A man of no intellect, or of bestial propensities. (*Johnson.*)

3. In the same sense as No. II. (*Zool.*) This signification of the word includes man.

". . . though defenceless. Man can arm himself with every variety of weapon, and become the most terribly destructive of *animals*."—*Owen: Classif. of the Mammalia*, p. 86.

II. *Technically:*

Zool.: An organic being, rising above a vegetable in various respects, especially in possessing sensibility, will, and the power of voluntary motion. Professor Owen defines an animal as an organism which can move, which receives nutritive matter by a mouth, which inhales oxygen and exhales carbonic acid, and, finally, which develops tissues, the proximate principles of which are quaternary compounds of carbon, hydrogen, oxygen, and nitrogen. (*Owen: Paleont.*, 1860, p. 4.) Though, practically speaking, there is in general no difficulty in distinguishing an animal from a vegetable, yet the animals and plants of humble organisation closely approach each other in structure, and it is not always easy to say whether a particular organism belongs to the one kingdom or the other. By his bodily organisation man is an animal, though his mental and moral qualities give him an immeasurable superiority over all the other members of the animal kingdom. (For the classification of animals, see ANIMAL KINGDOM.)

B. *As adjective:*

1. Pertaining to an animal as opposed to a vegetable, or to an animal as distinguished from the more general term, an organised being, as *Animal Functions* (q.v.).

"The *animal* membranes exercise the property. . ."—*Todd and Bowman: Physiol. Anat.*, vol. i., p. 54.

2. Pertaining to the inferior sentient beings as opposed to man; brutal.

"The immortal Aristotle, in his system of the *animal* world, excludes man from his scheme."—*Bentinus: Classific. of Quadrupeds*, § 15.

3. Pertaining to those parts of our complex nature which we have in common with the inferior sentient beings, as contradistinguished from those mental, moral, and spiritual capabilities in which man on the earth stands alone.

"There are things in the world of spirits, wherein our ideas are very dark and confused; such as their union with *animal* nature, the way of their acting on material beings, and their converse with each other."—*Watts: Logick.*

animal electricity, *s.* [GALVANISM.]

animal flower, *s.* A name often given to those radiated animals which have their tentacles in rows around their mouths, not unlike the petals of a double flower. The term has been applied specially to various species of the genus Actinia, which have been called, from their fancied resemblance to particular flowers, Sea Anemones, or fixed Sea-nettles. (Griffith's *Cuvier*, vol. xii., p. 572.) The other radiated animals which have been called animal flowers belong to the genera Holothuria, Tubularia, Sertularia, Hydra, and Alcyonia. [ACTINIA.]

animal food, *s.*

1. Food consisting of the flesh or other portions of animals.

† 2. Food designed for animals.

animal functions, *s. pl.* Functions exercised by animals. They are divided into two classes. (1) Those peculiar to and characteristic of animals, as distinguished from *organic functions*, which are common to them and vegetables. The animal functions of this first category are sensibility, or innervation, and voluntary motion, or locomotion. (2) The merely vital or vegetative functions, which are common to animals and vegetables. These are nutrition and generation. [ORGANIC FUNCTIONS.] (See Todd and Bowman's *Physiol. Anat.*, vol. i., p. 25.)

animal kingdom, *s.* One of the three great kingdoms of visible Nature, the other two being the Vegetable and the Mineral Kingdoms. Cuvier divided the Animal Kingdom into four great sub-kingdoms—1, Vertebrata; 2, Mollusca; 3, Articulata; and 4, Radiata. Professor Owen, in his Paleontology, adopts the following classification:—Kingdom I. Protozoa. Kingdom II. Animalia. Sub-kingdom I. Invertebrata: Province 1, Radiata; 2, Articulata; 3, Mollusca. Sub-kingdom II. Vertebrata. (See his *Paleontol.*, 1860.) Professor Huxley divided the Animal Kingdom into eight distinct groups:—Vertebrata, Mollusca, Molluscoida, Cœlenterata, Annuloса, Annuloida, Infusoria, Protozoa. It is now generally admitted that no exact line can be drawn between the lowest animals and the lowest plants; and classifications of animals are based on the principle of descent from a common ancestor, the term *phylum* being used instead of *Order*. Scarcely any two authorities agree as to the number of these *phyla* or tribes; but the following is a good working division: Protozoa (forming one phylum); METAZOA: Phylum 1, Cœlenterata; 2, Echinodermata; 3, Vermes; 4, Arthropoda; 5, Molluscoidea; 6, Mollusca; 7, Vertebrata.

animal oat, *s.* An oat (*Avena sterilis*), which has a beard so hygrometric that, when the seeds fall off, it twists itself and moves spontaneously, when certain alterations in the weather occur. "It rendered at once evident to the senses why air filtered through cotton-wool is incompetent to generate *animalcular* life."—*Tyndall: Frag. of Science*, 3rd ed., xi. 324.

ăn ĭm ăl′ cule, *s.* [Fr., from Lat. *animalculum* (q.v.). In Port. *animalculo*.] An animal so minute as to be visible only by means of the microscope. Animating Principle: An English term corresponding to the Greek ψυχη (*psuchē*), which means (1) breath, life; (2) soul; (3) reason; (4) a living spirit, supposed to go through all the earth and the ocean. It was called by the Romans *anima mundi*. In the plural, animating principles correspond to the Greek ψυχαι (*psuchai*). The hypothesis of Aristotle on the subject was that there were an infinite number of distinct animating principles, no two precisely identical with each other in qualities. Each of these necessarily had its corresponding body, which accounted

for the great diversities among the species of animated beings existing in the world. All, however, acted under the direction of the supreme animating principle or *φύσις* (*phusis*) = (1) growth, (2) outward form, (3) nature. The immortal Harvey held a somewhat similar belief, and the "*materia vitæ*" (material of life) of John Hunter, the "organic force" of Müller, and the "organic agens" of Dr. Prout are all akin to the *ψυχή* (*psuchē*), or animating principle of Aristotle. (See Todd and Bowman's *Physiol. Anat.*, vol. i., pp. 16, 17.)

† 1. *Generally:* The singular of the word ANNALS (q.v.). [ANNAL-WRITING.]

2. *Technically. In the Roman Catholic Church:* A mass said for an individual every day in the year, or annually on a particular day of each year. (*Du Cange.*)

B. *Plural* (Annals). [In Sw. & Dan. *annaler*; Ger. *annalen*; Fr. *annales*; Sp. *anales*; Ital. *annali.* From Lat. *annales* (pl.); rarely *annalis* (sing.) = year-books, yearly records, from *annus* = a year.]

1. *Properly:* The record of historical events arranged chronologically, and divided into yearly portions. In this sense the record of the important events in the Roman State, said to have been made annually for the first six centuries of its existence by those who successively filled the high office of Pontifex Maximus, were annals.

"Their model was the official *annals* of the year kept by the Pontifex Maximus."—*Lewis: Early Rom. Hist.*, ch. ii., § 8.

2. *More loosely:* Records of historical events, or even of less important incidents, although they may not be formally divided into yearly portions. There has been considerable dispute regarding the precise difference between annals and history. [See a dissertation on the subject by Niebuhr in the *Philological Museum*, vol. ii. (Cambridge, 1833), pp. 661-670.] Broadly speaking, annals are simple records or chronicles of events, in yearly portions or otherwise, without any effort to trace occurrences to their causes, to investigate the characters and motives of the chief actors, or to intercalate philosophical generalisations. When these elements are superadded to the bare chronicle of incidents then annals become history.

"Nor Grandeur hear with a disdainful smile
The short and simple *annals* of the poor."
Gray: Elegy.

I. *"Primitiæ" (First-fruits):*

1. *When the Papal power was dominant:* The first year's revenues of a benefice which each new incumbent was required to remit to the papal treasury. Cowel says that first-fruits were called *annates* because paid after one year's profit of a living had been obtained. The original imposition of annates is generally attributed to John XXII. in the fourteenth century, but they existed before his time. Valuations of them were made in England in A.D. 1254 and in 1292. (See Mosheim's *Church Hist.*, Cent. xiv., pt. ii., ch. ii., § 6, Murdoch's note; also Cent. xv., pt. ii., ch. ii., § 532.)

"Though the Council of Basil damned the payment of *annats*, yet they were paid here till Henry VIII. annexed them for ever to the crown."—*Bp. Barlow: Remains*, p. 172.

2. *Since the Reformation:*

(*a*) *In England:* The first-fruits exacted by Henry VIII. in England, at the Reformation, were the annates of the bishoprics, which the king had dissevered from the Pope. They were valued in A.D. 1535, the result being recorded in what was generally called *Liber Regis* (the King's Book). By this valuation the clergy still are rated. During the reign of Queen Anne, the annates were given up to form a fund for the augmentation of poor livings. [QUEEN ANNE'S BOUNTY.]

". . . which *annates*, or first-fruits, were first suffered to be taken within the realm, for the only defence of Christian people against the Infidels."—*Acts of Parl.*, 33 ann. Hen. VIII., 31.

"No *annates* would be sent any longer to Rome."—*Froude: Hist. Eng.*, ch. viii., vol. ii., p. 194.

(*b*) *In Ireland:* Before the passing of the first Reform Bill the annates were applied primarily to the repair of ecclesiastical buildings, and then to the augmentation of poor livings; but about a year after that event the annates were abolished, their place being supplied by a graduated tax on the higher clerical incomes.

(*c*) *In Scotland*, the annat is declared by Car. II., Parl. Sess. 3, cap. 13, to be due to the executors of a deceased minister, and to be half a year's stipend in addition to what he had earned by his official services up to the time of his death. [For details see *Compend of the Laws of the Church of Scotland* (1830), p. 326.]

II. *In the modern Church of Rome:* Masses said for a year either for the soul of a person deceased, or for that of a person living. (See Ayliffe's *Parergon.*)

ąn-nē'al, *v.t.* [A.S. *anælan* = (1) to kindle, to inflame, to light; (2) to anneal. From *ælan* = to kindle, light, set on fire, also to bake; *æl* = fire.]

I. *Literally:*

1. To heat a metal with the view of regulating its elasticity, or glass to render it less brittle, or to fix colours in it. When a metal is to be annealed it is raised to a temperature lower than the one necessary to temper it, and then allowed to cool slowly. The elasticity of the metal is thus diminished. Springs have thus imparted to them the precise measure of elasticity which is deemed the most suitable. Glass is similarly annealed. It is first heated, and then allowed to cool slowly. (See Ganot's *Physics*, 3rd ed., 1868, p. 63.)

"But when thou dost *anneal* in glass thy story,
. . . . . then the light and glory
More rev'rend grows, and more doth win,
Which else shews waterish, bleak, and thin."
Herbert.

"Beneath those chambers of the Sun,
Some amulet of gems *anneal'd*
In upper fires . . . ."
Moore: Paradise and the Peri.

† 2. To temper by cold. (*Shenstone.*)

3. To bake. (Used of tiles.)

II. *Figuratively:* To temper the character by the heat of suffering or trial, so as to enable it to endure more without being shattered.

"The mind to strengthen and *anneal*,
While on the stithy glows the steel!"
Scott: Rokeby, i. 31.

ạn-nēˊaled, *pa. par.* & *a.* [ANNEAL.]

"Both the poles, you find, attract both ends of the needle. Replace the needle by a bit of *annealed* iron wire, the same effects ensue." — *Tyndall: Frag. of Science*, 3rd ed., xiii. 381.

ạn-nēˊal-ĭng, * **ạ-nēˊal-ĭng,** *pr. par., a., & s.* [Sometimes corrupted into NEALING.]

As substantive: The process of first heating and then cooling a metal, with the view of regulating its elasticity or tempering it. The process of similarly treating glass to render it less brittle or fix colours in it.

ăn′-nĕl-ĭd, ăn′-nĕl-īde, * ăn′-ĕl-īde. ăn-nĕl′-ĭ-dạn, *s.* [ANNELIDA.] An animal belonging to the class Annelida. (*Huxley, &c.*)

ăn-nĕl′-ĭ-dạ, *s. pl.* [Lat. *annellus*, or *anellus* = a little ring, dimin. of *annulus*, or *anulus* = a ring.] A class of animals belonging to the sub-kingdom Articulata, the Annulosa of some naturalists. They are sometimes called Red-blooded Worms, being the only invertebrated animals possessing this character. They are soft-bodied animals, mostly living in the water, sometimes in moist earth, but never parasitically within the bodies of other animals; the higher ones possessing limbs, though of a rudimentary character, which makes them resemble centipedes; whilst the lower ones, like the leeches, are wholly destitute of these appendages. The respiration is effected by external branchiæ, by internal vesicles, or by the skin itself. Contractile vessels supply the place of a heart. The nervous system consists of a single or double ventral cord, furnished with ganglia at intervals, and surrounding the œsophagus above. Cuvier divided them into three orders—Tubicola, Dorsibranchia, and Abranchia; Milne-Edwards into Suctoria, Terricola, Tubicola, and Errantes; Professor Huxley into Chætophora and Discophora; and Griffith and Henfrey into Turbellaria, Suctoria (Apoda), and Chætopoda (Setigera). [ANNELLATA.]

ăn′-nĕl′-ĭ-dạn, *s.* [ANNELID.]

ăn′-nĕl-lāˊ-tạ, ăn′-ĕl-lāˊ-tạ, *s. pl.* [Lat. *anellus, annellus* = a little ring.] A name sometimes given to the class of animals called by Cuvier Annelida. It is thus used in the first edition of Owen's *Comparat. Anat. of the Invertebrate Animals* (1843), but in the second edition (1855) Annulata is the term used.

ăn-nū'-ĭ-tў, *s.* [Fr. *annuité*; Ger. *annuität*, from Lat. *annus* = a year.]

A. *Ordinary Language:* A fixed sum of money paid yearly.

Specially:

1. A yearly allowance.

"He was generally known to be the son of one earl, and brother to another, who supplied his expence beyond what his *annuity* from his father would bear."—*Clarendon.*

2. In the same sense as B., *Arithmetic, Law, &c.* (For example, see Annuitant.)

B. *Technically:*

1. *Arithmetic, Law, &c.:* A sum of money which, according to the etymology, should be paid annually, but is more frequently settled half-yearly or quarterly, given to one as a superannuation or other allowance for services rendered, in which case it is synonymous with a *pension*, or in consideration of its value in money paid beforehand. Under the Roman law annuities were sometimes granted by will, the obligation of paying them being imposed upon the heir. Borrowers in the Middle Ages were frequently obliged to grant annuities, in lieu of interest, the exaction of which by creditors was forbidden as usury; and the practice received the Papal sanction in the fifteenth century.

Annuities may be primarily divided into *annuities certain* and *life annuities.*

An *annuity certain* is one in which the annual payment does not depend upon any contingent event, but is to be made certain either in perpetuity or during a period named. A *perpetual annuity*, or *perpetuity*, differs from interest in this respect, that the purchaser of the former cannot demand back the principal, whilst if he has put his money out at interest he can. He may, however, sell his annuity to some one else, which is tantamount to obtaining the principal back. The other original party to the transaction can, as a rule, at any time terminate the obligation to pay the annuity by giving back the principal.

A *life annuity*, often called simply an annuity, is one payable during the lifetime of the annuitant or annuitants. An *immediate* annuity is one commencing at once, and payable whenever the stipulated period for the handing over of the first instalment arrives. A *deferred* or *reversionary* annuity is one of which the payments are not to commence till after the lapse of a considerable period. A man of forty, for example, may make provision for his declining years by purchasing an annuity not to commence till he is sixty, if he live so long. A *temporary* or *terminable* annuity is one which will cease at a certain stipulated time, say in twenty years, or at the death of an individual. The term or period for which it is to continue is generally called its *status*. An annuity not to commence till after a certain period, and then to continue for ever, is called a *deferred perpetuity*. Under the English system of finance, all Government annuities on the lives of individuals are terminable annuities; whilst the interest of the national debt, which is also called an annuity, is a perpetual one. It does not cease till that portion of the principal is paid off. An *annuity in possession* is one which has already commenced. A *joint annuity* on two lives is one payable only till one of the parties dies. Sometimes, again, an annuity is purchased which it is stipulated shall continue till two persons who are to receive it are both dead. The holder of an annuity is called an *annuitant*; the person on whose life the annuity depends, the *nominee*; and the annual sum paid, the *rent* or the *magnitude of the annuity.*

The calculation of annuities falls under the province of arithmetic. A perpetual annuity is easily calculated, the yearly payments of which it consists being simply interest on the principal given for its purchase. To calculate a life annuity it is needful to ascertain the probability of life in one of the age and sex of the applicant for an annuity. [Probability, Expectation, Life, Mortality.] The other element is what compound interest the sum paid for the purchase of the annuity would fetch during the number of years that the life is likely to continue.

The principles on which the value of annuities certain is calculated, are applicable also to the case of leasehold property.

The subjoined table shows the value of an annuity of £1 per annum, estimated on the life of a male or of a female, at the several ages given below, it being supposed that at the time of calculation interest is 3 per cent. annually. The purchase money is stated in pounds sterling and decimals of a pound:—

Age last Birthday.	Male.	Female.
0 ...	£18·1506 ...	£18·8502
10 ...	23·1071 ...	23·1470
20 ...	21·0612 ...	21·2093
30 ...	19·0143 ...	19·3374
40 ...	16·4744 ...	17·0353
50 ...	13·4242 ...	14·0942
60 ...	10·0176 ...	10·5274
70 ...	6·6100 ...	7·0162
80 ...	3·9192 ...	4·1872
90 ...	2·1788 ...	2·3277
100 ...	1·1671 ...	1·2415

In England, government annuities are now granted for sums not exceeding £50 annually at the several local Post Offices, whilst those above £50 may be procured at the National Debt Office. No similar system exists in the United States.

"These duties were to be kept in the Exchequer separate from all other receipts, and were to form a fund on the credit of which a million was to be raised by life *annuities*."—*Macaulay: Hist. Eng.*, ch. xix.

"The difference between a rent and an *annuity* are, that every rent is going out of land; but an *annuity* charges only the granter, or his heirs, that have assets by descent. The second difference is, that for the recovery of an *annuity* no action lies, but only the writ of *annuity* against the granter, his heirs, or successors; but of a rent the same actions lie as do of land. The third difference is, that an *annuity* is never taken for assets, because it is no freehold in law; nor shall be put in execution upon a statute merchant, statute staple, or elegit, as a rent may."—*Cowel.*

ăn-nŭl', *v.t.* [In Fr. *annuler*; Sp. *anular*; Port. *annullar*; Ital. *annullare*; Eccles. Lat. *annullo*; from *ad* = to, and *nullum*, accus. neut. of *nullus* = none.]

2. *Astron. An annular eclipse* of the sun is an eclipse in which the whole of the moon is seen upon the sun's disc. The moon, however, in certain positions being too small to cover the disc, the sun appears in a form more or less resembling a ring. At other times the moon is so situated as to be able to produce a total eclipse of the greater luminary. (*Herschel: Astron.*, 5th ed., 1858, § 425.) *An annular nebula* is a nebula of a form suggestive of a ring. Such nebula exist, but are among the rarest objects in the heavens. A nebula of this character, situated between the stars β and γ Lyræ, has been resolved by Lord Rosse's powerful telescope into a multitude of minute stars, with filaments of stars adhering to the edges. ăn-nū-lōī'-dą, *s. pl.* [Lat. *annulus* or *anulus* = a ring; and εἶδος (*eidos*) = form, appearance.] In Professor Huxley's classification, one of the eight primary groups into which he divides the Animal Kingdom. He places it between the Annulosa and the Infusoria. He includes under it (1) the Trematoda, or Flukes; (2) the Tœniada, or Tape-worms and Bladder-worms; (3) the Turbellaria; (4) the Acanthocephala; (5) the Nematoidea, or Thread-worms; and (6) the Rotifera, or Wheel Animalcules. But he thinks it not improbable that the Annuloida will require ultimately to be merged in the Mollusca. (*Huxley: Introd. to the Classif. of Animals*, 1869, pp. 81—86, 127, 128.)

ăn-nū-lō'-są, *s. pl.* [Lat. *annulus* or *anulus* = a ring.] A sub-kingdom of the Animal Kingdom, corresponding with Cuvier's Articulata. The word *Articulata*, signifying *jointed*, is not a sufficiently distinctive term, for the Vertebrated animals are also jointed. *Annulosa*, signifying *ringed*, is decidedly better, for the animals ranked under this sub-kingdom have their skeleton, which is external, composed of a series of rings. Prof. Huxley divides them into Chætognatha, Annelida, Crustacea, Arachnida, Myriapoda, and Insecta, these classes being ranged in an ascending order. The last four are further grouped together under the designation Arthropoda (q.v.).

ăn'-nų-lŭm ĕt băc'-ų-lŭm, *accus. sing. of two Lat. substantives with copulative* et. They are in the accusative because the preposition *per* is understood. [Lat. = (by means of) a ring and a staff or crosier.] [ANNULUS.] A ring and pastoral staff or crosier formerly delivered by kings to bishops on their election. These were designed, it was said, to confer the temporalities annexed to the spiritual office; but Pope Gregory VII. and his successors contended that the symbols adopted were not those of secular, but of sacred office. The papal views on the subject ultimately prevailed; and the Emperor Henry V., with the other European sovereigns, agreed to confer investitures not *per annulum et baculum*, but *per sceptrum*, by the sceptre, the undoubted symbol of temporal authority.

ăn'-nų-lŭs (plur. **ăn'-nų-lī,** *s.* [Lat. = a ring.]

I. *Bot.:* (1.) The thickened longitudinal ring which partially surrounds the sporangia of ferns. (*Lindley.*) (2.) The elastic external ring with which the brim of the sporangium in mosses is furnished. (*Ibid.*) (3.) That part of the veil in fungi which, remaining next to the stipes, surrounds it like a loose collar. (*Ibid.*)

II. *Anatomy:*

1. *Gen.:* Anything resembling a ring.

"They [the horns of the Nyl-ghau (*Antilope picta*)] are perfectly smooth and without *annuli*."—*Penny Cyc.*, ii. 75.

2. *Technically. Annulus ovalis:* A thick fleshy ring nearly surrounding the *fossa ovalis*, a depression on the middle of the septum in the right auricle of the heart. (*Todd and Bowman: Physiol. Anat.*, vol. ii., p. 335.)

III. *Astron.:* The "ring" of light left during a solar eclipse, when the sun's disc is almost covered by the dark body of the moon. [ANNULAR, 2.]

". . . an *annular* eclipse, a phenomenon to which much interest is attached by reason of some curious optical phenomena first observed by Mr. Baily at the moments of the forming and breaking of the *annulus*, like beads of light alternating with black thready elongations of the moon's limb, known by the name of 'Baily's beads.'"—*Herschel: Astron.*, 10th ed. (1869), § 425.

Anomalistic Period: "The time of revolution of a planet in reference to its line of apsides. In the case of the Earth, the period is called the *anomalistic year.*" (*G. F. Chambers: Astron.,* ed. 1867, *Gloss.*)

Anomalistic year: A year consisting of 365 days, 6 hrs., 13 min., 49·3 secs. It exceeds the sidereal year by 4 min., 39·7 secs., because owing to a slow motion which the longer axis of the earth's ellipse makes of 11·8 seconds yearly in advance, our planet is the number of minutes and seconds mentioned above in travelling from perihelion to perihelion. (*Herschel: Astron.,* 10th ed., § 384.)

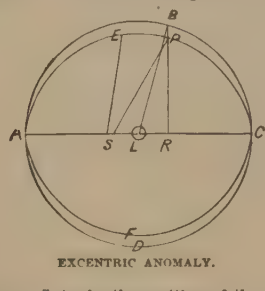
"The truth is that the dispensing power was a great *anomaly* in politics."—*Macaulay: Hist. Eng.*, ch. ii.

B. *Technically:*

1. *Astron.:* The deviation in a planet's course from the aphelion or apogee. It is of two kinds, the *true* and the *mean anomaly.* The true is that which actually takes place. The mean is the angular motion which would have been performed had the motion in angle been uniform instead of the motion in area. (*Herschel: Astron.*, 5th ed., § 499.)

Astron. Excentric Anomaly: "An auxiliary angle employed to abridge the calculations connected with the motion of a planet or comet in an elliptic orbit. If a circle be drawn, having its centre coincident with that of the ellipse, and a diameter equal to the transverse (major) axis of the latter; and if from this axis a perpendicular be drawn through the true place of the body in the ellipse to meet the circumference of the circle, then the excentric anomaly will be the angle formed by a line drawn from the point where the perpendicular meets the circle, to the centre, with the longer diameter of the ellipse." (*Hind.*)

Describe the circle A B C D, so that its centre L shall coincide with that of the ellipse, A E C F, in which the planet P moves, and its diameter A C be = the longer axis of the



EXCENTRIC ANOMALY.

ellipse. Let S be the position of the sun in one of the foci of the ellipse, then A is that of the planet when in perihelion, and C that which it occupies when in aphelion. Join P S, then the angle P S L is the *true anomaly.* Proximity to the sun made the planet travel more quickly at A than at C. If the rate had been uniform, it would not have reached P. Let it be supposed that it would have been only at E, then A S E is its *mean anomaly.* Let fall P R a perpendicular to A C from P; produce it in the other direction to B in the circumference of the circle; join B L, then A L B is the *excentric anomaly.* In calculating the motion of the moon, the earth is supposed to be at S, as it is also held to be when inquiry is made into the apparent course of the sun through the ecliptic.

2. *Music:* A small deviation from a perfect interval, in tuning instruments with fixed notes; a temperament.

He was made Bishop of Cyzicum in A.D. 360, and died about 394. The Anomeans were considered extreme Arians. They were condemned by the Semi-Arians at the Council of Seleucia in A.D. 359, but they soon afterwards retaliated at the Council or Synod of Constantinople.

ạ-nŏn′, *ạ-nŏ′on, *adv.* [A.S. *on* = in; *an* = one. Junius, Horne Tooke, &c., supply *minute*, and make *anon* mean primarily "in one minute." Webster believes it should be in continuation, in extension, applied first to extension in measure, and then by analogy to time. He quotes the Saxon Chronicle, A.D. 1022, where it is stated that a fire "weax on lengthe up an on to tham wolcne," which he freely renders, "increased in *continuation* to the clouds." See also, he adds, A.D. 1127. Morris brings *anon* from A.S. *anane*, *onane* = in one moment. (*Alliterative Poems, Gloss.*) In Bosworth's A.S. It has been called also Christianite and Biotine. Thiorsite is the same species from the plain of Thiorsa, near Hecla, in Iceland. (2) Indianite, from India. (3) Amphodelite, from Finland and Sweden, called also Lepolite. It includes Latrobite, from Labrador, and apparently Tankite from Norway. Besides these, Linseite and Sundvikite are altered Anorthite. Dana numbers Cyclopite, Barsowite, and Bytownite as if they too were not properly distinct from Anorthite.

(*Trench: Eng. Past and Present*, pp. 198 to 200.) A.S. *æmete*, *æmette*, *æmeta*, *æmytta*, *emete*, *emette*; Ger. *ameise.*]

1. *Ord. Lang. & Entom.*: The name given to certain small, but singularly intelligent and industrious insects well known in this and other lands. They are classed by naturalists under Hymenoptera, the first tribe of articulated Hymenoptera. Ants live in society like the more common species of wasps and bees. Like them also, their polity consists of three kinds of individuals, males, females, and neuters, the last-named being probably abortively-formed females. The males are winged during the whole course of their existence, the females only during the pairing season, and the neuters not at all. The males and females meet not in the ground, but in the air. Soon afterwards the males, which cannot do much for themselves, having neither stings nor even mandibles, perish of cold or other hardships. The females, on the contrary, immediately after meeting with the other sex in the air, lose or actually pull off their wings, are found by neuters, and become the object of their tender care. The neuters are the most numerous class of ants, and do nearly the whole work of the community. Specially, they carry the eggs, the larvæ and the cocoons from place to place in the nest, as the temperature and moisture vary; they feed the larvæ with liquid scraped from the stomach, and bestow upon the cocoons for them when they are ready to emerge as perfect insects. Hence the neuters are sometimes called workers or nurse-ants. Sir John Lubbock says that ants can distinguish colors, being particularly sensitive to violet. They have very delicate smell, but apparently no hearing. The different species present curious analogies to the earlier states of human progress—the hunting and pastoral, and even the agricultural—as has been noted by several authorities. There are various genera and species of ants, differing in habits and methods of operation. Some, like *Formica sanguinaria* and *F. rufescens*, have been called Mound-ants; others as *F. fusca*, produce a kind of masonry, while *F. rufa*, the Wood-ant, similarly addresses itself to carpentry. Finally, some ants keep aphides as graziers do much cows, on account of a secretion which they yield; and others hold slaves, the eggs, larvæ, and pupæ of which they have captured in war. Of these the most notable is the Amazon-ant. [AMAZON, No. 4. See also HETEROGYNA, FORMICA, MYRMICA ATTA, &c.]

¶ The ant of Scripture, Heb. נְמָלָה (*nemâlâh*), Sept. μυρμηξ (*murmēx*), Vulg. *formica*, seems correctly translated

"Go to the ant, thou sluggard; consider her ways, and be wise."—*Prov.* vi. 6.

"The *ants* are a people not strong. . . ."—*Prov.* xxx. 25.

2. *Figuratively*: The White Ant [TERMITES], which is not a genuine ant at all, but a neuropterous insect. [ANTHILL.]

ant-bear, *s.* The name generally given in Demerara to the Great Ant-eater, *Myrmecophaga jubata*. [ANT-EATER, MYRMECOPHAGA.]

ant-eater, *s.*

1. The English name of the animals belonging to the genus Myrmecophaga of Linnæus. [Gr. μυρμηξ (*murmēx*) = an ant, and φαγός (*phagos*) = a glutton; φαγειν (*phagein*) = to eat.] They have a lengthened muzzle terminated by a small, toothless mouth, from

THE ANT-EATER.

which they protrude a long, thread-like tongue, covered with viscous saliva. This they thrust into the nests of termites or those of ants proper, sucking the animals which adhere to it up into their mouths. Their claws are strong, and are used for tearing to pieces the structures erected by the Termites. Among the species may be enumerated the *M. jubata*, the Great or Maned Ant-eater, which has four toes before and five behind, and the *M. didactyla*, the Little or Two-toed Ant-eater. Both are South American.

The Scaly Ant-eaters are of an allied genus, Manis. They derive their English name from the fact that they are covered with thick scales, which give them the superficial appearance of reptiles. The Short-tailed Manis, *M. pentadactyla*, Linn., is found in Bengal and the Indian Archipelago, and *M. tetradactyla* in Africa. The proper and Scaly Ant-eaters belong to the mammalian order of Edentata, or toothless animals. To the same order belong the Cape Ant-eaters (*Orycteropus Capensis*. [AARD-VARK.] Prof. Owen considers it remarkable that "not a trace of a Scaly Ant-eater, recent or extinct, has been discovered in South America, where the Edentate order is so richly represented by other generic and specific forms." (*Owen: British Fossil Mammals and Birds*, 1846, p. xxxix.)

The Porcupine Ant-eater, or *Aculeated Ant-eater* (*Echidna Hystrix*), is not closely allied to the species now mentioned, but is one of the Monotremata. [ECHIDNA.]

2. *The King of the Ant-eaters*: A bird, the *Turdus rex* of Gmelin, and *Corvus grallarius* of Shaw, now *Grallaria rex*. [ANT-CATCHER, ANT-THRUSHES.]

ant-eggs, ants' eggs, *s. pl.*

1. *Accurately*: The eggs of ants. They are of different sizes and in small parcels, so that they can be moved from place to place.

2. *Popularly, but erroneously*: The elongated egg-looking bodies which ants when disturbed seem so anxious to carry off. They are not eggs, but cocoons. They have been recommended as food for the nightingale and other birds, and have been extensively used for feeding pheasants and partridges.

ant-hill, *s.* & *a.* [In A.S. *æmete-hyll*, *æmette-hyll.*]

A. *As substantive*:

1. The mounds or hillocks raised by some species of ants proper. There are many in the mountains of Pennsylvania, in the Eastern States, and elsewhere.

"Put blue flowers into an *ant-hill*, they will be stained with red; because the ants drop upon them the *stinging* liquor, which hath the effect of oil of vitriol."—*Bacon.*

2. The much more remarkable erections made by different species of termites (white ants). In most cases the descriptions of unscientific travellers refer to these rather than to the constructions of the ants proper. The nest of the African *Termes bellicosus* is described by Sparrmann as rising ten or twelve feet above the surface of the earth. Its shape is that of a sugar-loaf. Externally it is covered with a broad cap, whilst inside it is divided into a multitude of chambers. The *T. atrox* and the *T. mordax* build nests two feet high with conical roofs, called turretted nests. [WHITE ANT and TERMES.]

B. *As adjective*: In various respects presenting the characteristics of an ant-hill like those just described; small, petty.

". . . all things that do pass,
Upon this *ant-hill* earth."
Thomson: Castle of Indolence, I. 69.

ant-hillock, *s.* Nearly the same as ANT-HILL (q.v.), but smaller.

"Those who have seen *ant-hillocks* . . ."—*Addison.*

ant-like, *a.* Like an ant.

ant-lion, *s.* The English name of a genus of insects. [MYRMELEON.] It belongs to the order Neuroptera, and has gauzy wings like a dragon-fly, from which, however, it may be at

a. Perfect Insect. b. Larva.

once distinguished by having longer antennæ. The species are called Ant-lions from the extraordinary habits of their larvæ, which construct a funnel-shaped pitfall in the sandy or dusty ground, at the bottom of which they bury themselves all but their antennæ. When ants or other insects are hurrying along they are apt to miss their balance and tumble into the pitfalls, where they are at once devoured. It is said that when they do not quite lose their equilibrium on the brink of the abyss, they are helped into the jaws of death by a shower of sand or dust flung up from below. Ant-lions occur in the south of Europe, in India, &c.

ant-thrushes, † ant-catchers, ant-eaters, *s. pl.* Names given to the several species of birds placed by Illiger under his genus Myiothera, and some of its immediate allies. They belong to the family Turdidæ, and the sub-family Formicatinæ, called Myotherinæ by Swainson. They live on insects, especially on ants. They are found in both continents, but those of the Old World have the more brilliant plumage. The Common Dipper (*Cinclus aquaticus*), a British bird, is arranged in the same sub-family. The names Ant-thrushes or Ant-catchers are preferable to that of Ant-eaters, used in Griffith's *Cuvier*, vol. vi., 399, as the latter designation has long been pre-occupied for various mammalian animals.

A. *Ordinary Language:*

1. *Lit.:* The English equivalent of the large zoological genus Antilope, or sub-family Antilopina. For its scientific characters see the former of these two words. Most antelopes are deer-like animals of great elegance. They have large lustrous eyes; are swift of foot, and take enormous leaps, when flying from a foe, when wishing to clear a bush or other obstacle in their path, or in the exuberance of their activity, apparently for very wantonness. The species referred to by Moore in the examples quoted is the common Indian antelope (*Antilope cervicapra,* Pallas), common in the Deccan and other parts of the Indian empire. [SASIN.]

The silver footed *antelope*
As gracefully and gayly springs

The true chamomile plant has a fine smell, in this differing from another common species of anthemis, the *A. cotula*, or "Stinking Chamomile." The latter plant, moreover, is erect, whereas the former is prostrate. A third species, the *A. arvensis*, or Corn Chamomile, is local. Two others, the *A. tinctoria*, or Ox-eye Chamomile, often cultivated in consequence of its having medicinal qualities like the common species, and the *A. Anglica*, or Sea-chamomile, are doubtfully native. A brilliant yellow dye, derived from the first of these plants, is used in France.

The hallux is nearly as long as the second toe, and is susceptible of being moved both backward and forward only to a very limited extent, whereas in the Simiadæ it is much more mobile. In Man the arms are shorter than the legs, whilst in the Simiadæ they may be either longer or shorter. After birth in Man the legs grow faster than the rest of the body, whilst in the Simiadæ they do not. Man's stature is erect, whilst the natural attitude of the apes and monkeys is on all fours. (Professor Huxley's *Classification of Animals*, p. 99.) Man has a higher facial angle and a brain of greater volume than the monkeys, and his mental and moral powers are infinitely greater.

ăn thro pol ŏ gy, *s.* [In Gr. A Fr. [illegible] Port. *antropologia.* From Gr. *ἀνθρωπος* (*anthrōpos*) = man; and *λογος* (*logos*) = . . . discourse.]

I. *Natural Science:*

1. *Gen.:* The science of man in the widest sense of the terms. The word *anthropology* figures in Johnson's Dictionary with the signification, "The doctrine of anatomy: the doctrine of the form and structure of the body of man." The *Glossographia Nova*, 2nd ed., explains it to be "a discourse or description of a man or of a man's body." Kant gave a much wider range than this to the subject in his *Anthropologie*, published about the year 1798, as he had previously done orally in his university lectures. Finally, the Anthropological Society of London defined its aim to be "to study man in all his leading aspects, physical, mental, and historical, to investigate the laws of his origin and progress, to ascertain his place in nature, and his relation to the inferior forms of life." In this sense ethnology is a department of anthropology.

"The science of Man, therefore, or, as it is sometimes called, *Anthropology*, must form the crown of all the natural sciences."—*Max Müller: Science of Language*, vol. ii. (6th ed., 1871), p. 7.

2. *Spec.:* The science which investigates the relation in which man stands to the inferior animals. In this sense ethnology is a cognate science to anthropology. Dr. Latham uses the word in this limited sense.

ăn-thrō-pŏ măn -çy, *s.* [Gr. *ἀνθρωπος* (*anthrōpos*) = a man, and *μαντεια* (*manteia*) = power or mode of divination; *μαντευομαι* (*manteuomai*) = to divine; *μάντις* (*mantis*) = one who divines, a seer.] Fancied divination by inspecting the entrails of a human being. (*Webster.*)

ăn-thrō-pŏm -ĕt-rỹ, *s.* [Gr. *ἀνθρωπος* (*anthrōpos*) = man, and *μέτρον* (*metron*) = a measure.] The measuring or measurement of the human body; the science which deals with the proportions of the human body.

ăn-thrō pŏ morph -ĭc, *a.* [Gr. *ἀνθρωπομορφος* (*anthrōpomorphos*) = of human form; *ἀνθρωπος* (*anthrōpos*) = man, and *μορφή* (*morphē*) = form.] Pertaining to anthropomorphism.

"From some quarter or other the *anthropomorphic* force came in."—*Gladstone.*

ăn-thrō-pō-morph -işm, *s.* [In Ger. *anthropomorphism*; Fr. *anthropomorphisme*; Port. [illegible]: Gr *ἀνθρωπομορφία* (*anthrōpomorphia*) = human form; *ἀνθρωπος* (*anthrōpos*) = man, and *μορφή* (*morphē*) = form, shape.]

Properly: The attributing of a human form to God. When this is really done it is a gross degradation of the divinity, and is condemned in Scripture. But when the only anthropomorphism is the use of metaphorical phrases, such as the arm of the Lord (Ps. lxxvii. 15), or his eyes (Ps. xi. 4), or his ears (Ps. xxxiv. 15), to make abstract ideas more readily conceivable, the practice has the countenance of Scripture itself. There are thus in this sense a legitimate and an illegitimate anthropomorphism.

"*Anthropomorphism* is always connected with anthropopathism."—*Smith & Wace: Dict. Christ. Biog.*, vol. i., p. 148.

ăn thro pō-morph -ĭst, *s.* [In Ger. *anthropomorphist.*] One who really or apparently attributes to God the human form, or thoughts, emotions, or passions like our own.

II. *Technically:*

1. *Church Hist.* (*pl.*): A sect which arose in Egypt in A. D. 395, and became prominent in the fifth century. They were a sub-division of the Acephali, who again sprung from the Monophysites or Eutychians. They held anthropomorphism in a gross form. Many ecclesiastics also in the Church catholic, and in the sects which had sprung from it, entertained a similar belief. (*Mosheim: Ch. Hist.*, Cent. V., pt. ii., ch. v., § 20.)

"The *Anthropomorphites* who swarmed among the monks of Egypt and the Catholics of Africa . . ."—*Gibbon: Decline and Fall*, ch. xlvii.

2. *Theol.:* The attributing of human thoughts, emotions, or passions to God. As in the case of anthropomorphism, this may be legitimate or illegitimate. It is the former if done only figuratively; it is the latter if done really.

(*a*) *Figuratively:* "And it repented the Lord that he had made man on the earth, and it grieved him at his heart" (Gen. vi. 6).

(*b*) *Really:* "Thou thoughtest that I was altogether such an one as thyself" (Ps. l. 21).

Those which are still loosely compacted together, being generally spelt with a hyphen, follow as compounds under *anti*; whilst those in which the union has become more complete, the hyphen being generally dropped, are arranged as primary words. In the case of the former, the usage of authors or printers (it is uncertain which) with regard to the employment of capital letters varies in three ways:—

(1) There may be one capital commencing the word Anti-, as *Anti-arminian*. (*Bishop Bramhall.*)

(2) There may be one, but beginning the second of the two words in the compound, as *anti-Realism*, *anti-heroic sloth* (*Herbert Spencer*); *anti-Galilean* (*De Quincey*); *anti-English* (*Freeman*); *anti-Republican* (*Times* newspaper).

Or (3) each of the words united may begin with a capital, as *Anti-Judaic* (*Milman*); *Anti-Lawism* (*Carlyle*).

(*b*) *With* in the word *withstand*, and *gain* in *gainsay*, are equivalents in signification, though not in etymology, to the Greek *ἀντί* (*anti*).

† **B.** [From Lat. *ante* = before, as *anticipate*, in Lat. *anticipo* = to take beforehand; *ante* = before, and *capio* = to take.] Before, beforehand, as *anticipate*. (See etymology of B.)

A certain oath having been instituted in Edinburgh, Glasgow, and Perth, to be taken as a criterion of burghership, many members of the Associate Synod, or Secession Church, considered its terms to be such that they could not conscientiously take it. Others declared that they could. The Secession in consequence split into distinct bodies—the "Burghers," who took the oath, and the "Anti-burghers," who refused it. Another schism ultimately followed, owing to the conflict between progressive and conservative ideas; and thus there were produced four distinct denominations—viz., the Old Light Burghers, the New Light Burghers, the Old Light Anti-burghers, and the New Light Anti-burghers. Most of these are now merged in the United Presbyterian Church, and their old denominations are becoming obsolete. (*Burton: Hist. Scotland.*)

ăn-til-ŏ-pē, [Fr. *antilope*, from Arabic.]

A group of ruminating quadrupeds belonging to the family Bovidæ. They have many of the characters of the goats, but the horns are never knotted, and the hoofs are more slender. Their bodies are slender, and their limbs long and graceful. Their tails are short, and they have no beard. They are found in Africa, Asia, and America, but not in Europe. Many of the species are very beautiful, and are remarkable for the speed with which they run. Some of them are gregarious, and others live in pairs. Their flesh is much esteemed as food. The Antelopes are divided into many genera, of which the following are the principal: Addax, Algazel, Bubalis, Cervicapra, Dorcas, Gazella, Hippotragus, Leptoceros, Oryx, Saiga, Strepsiceros, Tragelaphus, and Tragocerus. Some of the species, such as the Addax, Algazel, Bubalis, Cervicapra, Dorcas, Gazella, Hippotragus, Leptoceros, Oryx, Saiga, Strepsiceros, Tragelaphus, and Tragocerus, have made Antilope not a [illegible] again, have made Antilope not a [illegible]

of the Antelopes, the Bubalines (*A. bubalina*, Sturmann); the Rhebok (*A. capreolus*, [illegible]); the Bushbuck (*A. sylvatica*, [illegible]); the Duikerbocs (*A. grimmia*, [illegible]); the Gnu or Gnoo (*A. gnu*, Gmelin; *Catoblepas gnu*, Smith); the Brindled Gnu (*A. pygarga*, Smith). Pringle alludes to several of these species, but "the gazelle" of which he speaks is not that of North-Eastern Africa.

"By valleys remote where the aloe plays
Where the cane and the cassada wave,
And the graceful gazelle with wild delight
By the skirts of grey forests darting with wild vine."
Pringle: After to the Desert.

Among the antelopes from other parts of Africa and Asia are the Mendesian (*A. addax*, Lichtenstein; *Oryx addax*, [illegible]); the Abyssinian; the Gazelle (*A. dorcas*, Pallas) (*Gazella dorcas*), from Egypt and Barbary; the Addax (*A. addax*, Lichtenstein; *Oryx addax*, [illegible]); the Leucoryx, Pallas) (*Leucoryx*), in Senaar and Kordofan; the Bekr-el-Wash (*A. bubalus*,

Pallas), from Barbary; and the Bush Antelope (*A. silvicultrix*, Afzelius; *Cephalophus sylvicultrix*, Smith), from Sierra Leone. Next to Africa, Asia, including the Eastern Archipelago, is the most important habitat of the genus. The Sasin or Common Antelope of India is *A. cervicapra*, Pallas; and in the same country the Nylghau (*A. picta*, Pallas; *Portax picta*, Smith); the Chickara (*A. quadricornis*, Blainville; *Tetracerus chickara*, Leach), &c. Other species are in Western Asia, Thibet, Sumatra, but none appear to exist in Australia or Madagascar. In Europe there is a typical one—the Saiga (*A. colus*, Smith), found in Roumania, Poland, and Russia, and one of a more aberrant character, with affinities to the goats—the Chamois (*A. rupicapra*, Pallas; *Rupicapra vulgaris*, Smith), in the Alps, Pyrenees, Carpathians, and the mountains of Greece. The New World has only two undisputed species—the Rocky Mountain sheep or goat (*Haplocerus laniger*), a true antelope; and the Prongbuck, called goat by the fur-traders. It is *Antilope* or *Dicranus furcifer* (Smith), and is found in the western part of North America.

¶ Some of the above species of antelope have other designations than those now given. The Springbok is now frequently called *Gazella euchore*; the Blessbok, *Gazella albifrons*; the Blaubok (blue antelope), *Gazella leucophæa*; the Eland, *Boselaphus oreas* or *Oreas canna*; the Brindled Gnu (bastard wild beast), *Catoblepas gorgon*; the Addax, *Addax nasomaculata*; the Chickara, *Tetracerus quadricornis*; the Saiga, *Colus saiga* or *Antilocapra saiga*; and the Chamois, *Rupicapra tragus*.

Antimonic chloride, or *antimony pentachloride*, $SbCl_5$, is obtained as a colourless volatile fuming liquid by passing excess of chlorine over the metal or the trichloride. On distillation it decomposes into $SbCl_3$ and Cl_2.

Antimonic tetroxide, or *antimonoso-antimonic oxide*, Sb_2O_4 or $Sb_2O_3.Sb_2O_5$, obtained

by heating the metal on trioxide. It is a yellow infusible non-volatile powder, insoluble in acids, but dissolves in alkalies.

Antimonic oxide, Sb_2O_5. Obtained by the action of HNO_3 on the metal. It is a yellow insoluble powder, which by heat is converted into the tetroxide. Its hydrate forms salts called *antimoniates*; those formed from the hydrates of the trioxide are called *antimonites*. By adding water to antimonic chloride, Sb_2Cl_5, a hydrate is precipitated called *metantimonic acid*, $H_3Sb_2O_7$. The acid *sodium metantimoniate*, $Na_2H_2Sb_2O_7+6H_2O$, is insoluble in water.

Chemistry: A compound of antimony and some other element or metal.

ăn-tĭ-mō′-nĭ-oŭs, *a.* [Eng. *antimony*; *-ous.*] Containing as one of its ingredients antimony.

Antimonious chloride, or *antimony trichloride*, $SbCl_3$, called also *butter of antimony*. By dissolving the metal or the sulphide in strong HCl, and distilling the liquid, $SbCl_3$ volatilises and forms a white crystalline mass.

Antimonious oxide, or *antimony trioxide*, Sb_2O_3. Obtained by decomposing $SbCl_3$ with an alkaline carbonate. It is a colourless powder, crystallising in octohedra; it becomes yellow when heated, melts at red heat, and volatises in a close vessel, but absorbs oxygen from the air, and becomes Sb_2O_4. Antimonious oxide dissolves in cream of tartar, forming tartar emetic, or potassium antimony tartarate, $2(C_4H_4K(SbO)O_6)+H_2O$.

Antimonious sulphide, Sb_2S_3, occurs native as a lead-grey, shining, crystalline, brittle mineral; sp. gr. 4·6; easily fusible, and a good conductor of electricity. It is used in horse medicine and in Bengal lights. When precipitated by H_2S it is an orange-red powder, which is soluble in ammonium sulphide. *Kermes mineral* is a mixture of Sb_2S_3 and Sb_2O_3. *Sulph-antimonites* are compounds of Sb_2S_3 with basic sulphides.

Antimony pentasulphide, or *antimonic sulphide*, Sb_2S_5, is a yellow-red powder obtained by decomposing sodium sulphantimoniate, Na_3SbS_4, a crystalline substance.

Antimoniuretted hydrogen, or *antimonious hydride*, or *stibine*, SbH_3. Obtained by the action of HCl on zinc, in the presence of an antimony salt. It is a colourless gas, burning with a white flame, liberating Sb_2O_3. At red heat it deposits metallic antimony; passed through a solution of $AgNO_3$, it deposits a black precipitate of $SbAg_3$.

ăn-tĭ-mŏn-ō-phўl′-līte, *s.* [Ger. *antimon*; Gr. *φύλλον* (*phullon*) = leaf, and suff. *-ite.*] A mineral occurring in thin angular six-sided prisms. Its precise locality is unknown. It was originally named by Breithaupt. Dana considers that it is probably the same as VALENTINITE (q.v.).

ăn′-tĭ-mŏn-ў, *s.* [In Ger. *antimon*, *antimonium*; Sw. & Mediæv. Lat. *antimonium*; Fr. *antimoine*, wrongly said to be made up of *anti* = against, and *moine* = monk. This form is said to have arisen from the fact that the celebrated alchemist Basil Valentine, who was a German monk, having observed that hogs fattened on antimony, administered some of it to render a similar service to his fellow monks, but found the well-meant prescription attended by fatal results. The narrative is evidently mythic. Hence Morin derives it from Gr. *ἀντί* (*anti*) = against, and *μόνος* (*monos*) = alone, because it is not found alone; an improbable etymology. The word is probably of Arabic origin. In Class. Lat. *stibium* or *stimmi*, Gr. *στίμμι* (*stimmi*), is = antimony, or rather sesquisulphuret of antimony.]

I. *Chemistry:* Antimony is a triad metallic element, but in some less stable compounds it appears to be pentad. Symbol, Sb.; atomic weight, 122; sp. gr., 6·8; melting-point, 450°. It can be distilled, but takes fire when strongly heated in the air, forming Sb_2O_3. Antimony is a bright bluish-white, brittle, easily pulverised metal, which occurs as Sb_2S_3, and as *cervanite*, Sb_2O_4; also as *valentinite* and *senarmonite*, Sb_2O_3. The metal is obtained by heating the sulphide with half its weight of metallic iron, or with potassium carbonate. It is oxidised by nitric acid, forming Sb_2O_5. Type metal is an alloy of lead with twenty per cent. of antimony. Finely powdered antimony takes fire when thrown into chlorine gas. It forms three oxides: (1) Antimony Trioxide, or Antimonious Oxide; (2) Antimonic Tetroxide, or Antimonoso-antimonic oxide; and (3) Antimonic Oxide. (See these words.) Antimony also forms bases with alcohol radicals, as *Trimethylstibine*, $Sb(CH_3)_3$. Salts of antimony are used in medicine; in large doses they are poisonous. Antimony is detected by the properties of its sulphide, chloride, and of SbH_3. It is precipitated by metallic zinc and iron from its solutions as a black powder. Copper is covered by a metallic film. Antimony salts, when fused on charcoal with Na_2CO_3, give a white incrustation and a brittle metallic bead, converted by nitric acid into a white oxide soluble in a boiling solution of cream of tartar. Antimony is precipitated by hydric sulphide, H_2S (see ANALYSIS), as an orange-red powder, sulphide of antimony, SbS_3, which is soluble in sulphide of ammonium, again precipitated by hydrochloric acid. With potash the solution of trichloride of antimony gives a white precipitate of the trioxide, soluble in large excess. Ammonia gives the same precipitate, which is insoluble in large excess; but if tartaric acid is present these precipitates dissolve easily. A liquid containing antimony salts, treated by zinc and dilute sulphuric acid, yields antimoniuretted hydrogen, SbH_3, which burns with a bluish tinge. A deposit of antimony takes place on a cold porcelain plate held in the flame. This metallic film may be destroyed from arsenic by dissolving it in *aqua regia*, and the solution treated with H_2S, which gives the characteristic orange sulphide. Or moisten the metallic film with nitric acid, evaporate the acid without boiling, a white deposit of trioxide of antimony remains, which gives a black spot with ammonio-nitrate of silver. A film of arsenic treated in the same way gives either a yellow precipitate of arsenite or a red-brown precipitate of arseniate of silver.

II. *Mineralogy:* Antimony occurs native, occasionally alloyed with a minute portion of silver, iron, or arsenic. Its crystals are rhombohedral; hardness, 3—3·5; sp. gr., 6·62 to 6·72; its lustre is metallic; its colour and streaks tin white. It is very brittle. It occurs in Sweden, Germany, Austria, France, Borneo, Chili, Mexico, Canada, and New Brunswick.

Arsenical Antimony: A mineral, called also Allemontite (q.v.).

* *Butter of Antimony:* A name formerly given to the *trichloride*, or *Antimonious Chloride*, the formula of which is $SbCl_3$. It is a white highly crystalline mass, very deliquescent. It is used as a caustic for foot-rot in sheep.

* *Glass of Antimony:* An impure oxide of antimony fused.

Gray Antimony: A mineral, called also Stibnite (q.v.).

* *Male Antimony:* A trivial name sometimes given to a specimen of antimony ore in which veins of a red or golden colour occur, whilst one in which they are wanting is denominated Female Antimony.

White Antimony: A mineral, called also Valentinite (q.v.).

III. *Pharmacy:*

Black Antimony consists of native sulphide of antimony fused and afterwards powdered. It is not itself used as a drug, but is employed in preparing tartar emetic, sulphurated antimony, and terchloride of antimony. It is given to horses as an alterative powder: 2 parts of sulphur, 1 of saltpetre, and one of black antimony. > "That doctrine that holds that the covenant of grace is not established upon conditions, and that nothing of performance is required on man's part to give him an interest in it, but only to believe that he is justified; this certainly subverts all the motives of a good life. But this is the doctrine of the *Antinomians.*"—*South: Serm.*, vii. 195.

(*Mosheim: Church Hist.*, Cent. xvi., sect. iii., pt. ii. 26.)

A. *Ordinary Language:*

1. *Of beings susceptible of emotion:* The state of feeling exactly the contrary to what another feels; the opposite of sympathy. The natural result of this [illegible] contrariety of feeling is a drawing back from, an aversion to, a hatred of. Though really a distinct meaning from the former, the two are so closely connected that they are scarcely ever dissevered. Antipathy is used—

(*a*) Of man to man:

"*Antipathy* [illegible] towards this or that particular individual. — *Sermons: Bp. Wilkins' Works*, vol. i., p. 299.

2. *Of inanimate things, or of abstractions:* Mutual repulsion, as that of oil and water, or certain other chemical substances to each other, or figuratively, of good and evil.

It takes its departure from the upper part of the left ventricle of the heart, whence it runs upward and to the right, at that part of its progress being called the ascending aorta; then it turns to the left, passes the spinal column, and bending downwards forms the arch of the aorta. Continuing its course along to the left of the spine, it is called the descending aorta. Passing through the aperture in the diaphragm into the abdomen, it becomes the abdominal aorta. Finally, it bifurcates about the fourth pair of lumbar vertebræ, and forms the two primitive iliac arteries. Upwards from the heart the ramifications are numerous and exceedingly important. Zoology (*Plur.*): The highest, or anthropoid section of the order Quadrumana, or Monkeys—that which forms the connecting link between the lower animals and man. [ANTHROPOID, ANTHROPIDÆ.] They have the teeth of the same number and for a time of the same form as those of man, but when full maturity is reached the canines become almost extremely prominent, as may be perceived by examining specimens in Museums of Natural History. There is no tail; nor are there cheek-pouches. There may or may not be callosities on the hinder parts. They are four-handed rather than four-footed. They hobble on the ground, but are splendid climbers of trees. The facial angle is about 65°, almost equal to that of some negroes; but the least intellectual of mankind are inconceivably before the highest of the monkey race. The apes are the only Simiidæ in which the hyoid

2. *Figuratively:*

" . . and to him who treads
Rome for the sake of ages, Glory sheds

Byron: Childe Harold, iv. 148.

B. *Technically:*

1. *Anatomy, Zoology, Botany, &c.:*

(*a*) The aperture of a univalve shell is the opening or mouth. In molluscs which feed on vegetable matter it is entire; while in those which are animal feeders it has a notch or canal. In some families it has an *operculum* or cover. The margin of the aperture is called the *peristome.* (*Woodward: Mollusca*, 1st ed., 1851, p. 101.)

(*b*) Any other opening.

" . . the back *aperture* of the nostrils."—*Owen: Classif. of Mammal.*, p. 29.

2. *Optics:* The diameter of the object-glass of a refracting telescope, or the speculum or mirror of a reflector. The larger the aperture (*i.e.*, the area of the surface through which the light is transmitted, or from which it is reflected), the greater is the power of the telescope to penetrate into space and consequently bear higher magnifying powers. The apertures of Sir W. Herschel's celebrated reflecting telescopes were 7, 12, 18, and 48 inches; while those of the Earl of Rosse are 3 and 6 feet. Very powerful refracting telescopes with large apertures have been recently constructed, that at the Lick Observatory being 36 inches, while still larger ones are projected. Within the last few years silvered-glass parabolic mirrors of the Newtonian form have been constructed with large apertures and short focal length, thus rendering these instruments exceedingly convenient for use. Sir W. Herschel's 18-inch metallic speculum, used for examining the nebulæ and Milky Way, had a focal length of 20 feet; modern telescopes, with silvered-glass mirrors, have been constructed of the same aperture, but with a focal length of not more than 7 feet. Thus a larger aperture is now a more valuable feature in a telescope than great focal length, the unwieldy tubes formerly used being entirely dispensed with.

"'*Aperture*' always means the clear space which receives the light of the object; the diameter of the object glass in achromatics, or the large speculum in reflectors, exclusive of its setting."—*Webb: Celestial Objects*, 3rd ed. (1873), p. 1.

Angular aperture (*in microscopes*): The amount of light transmitted by the objective, and consequently the distinctness of the image afterwards magnified by the lenses forming the eye-piece When an objective of the largest angular aperture is employed, the more delicate markings of the object under examination, invisible when objectives of less angular aperture are used, are seen with great distinctness. [OBJECTIVE.]

ā'-phĭs, ăph'-ĭs (plural **ā'-phĭ-dēş, ăph'-ĭ-dēş**), *s.* [Mod. Lat.]

Entom.: Plant louse. A genus of insects, the typical one of the family Aphidæ. It contains those soft pulpy little animals, winged or wingless, and with long antennæ, which are seen beneath the leaves, or in curled-up leaves, or in the axils of many plants, or even on the roots of some. Sometimes, as in the case of the elm, their destructive operations upon a leaf raise a gall of considerable size. The species are very numerous, and are generally called after the plants on which they feed, as *A. rosæ,* the

APHIDES.

aphis of the rose; *A. fabæ,* the bean apis; *A. brassicæ,* the cabbage fly; *A. humuli,* the hop fly. They are exceedingly prolific, but are kept within bounds by various insects, especially by the Coccinellidæ, or Lady-birds, of which they are the appropriate food. They drop a fluid called honey-dew [HONEY-DEW], which is so grateful to the ants, that the latter, to receive it, tend them like milch cows. The mode of propagating their race is the abnormal one described as ALTERNATION OF GENERATIONS, METAGENESIS, and PARTHENOGENESIS (q.v.). The winged aphides, confessedly perfect insects, bring forth a wingless race, apparently mere larvæ, and which, therefore, it might be thought, would be incapable, while thus immature, of bringing forth young. In certain cases they do it, however, and their offspring are winged, and as perfect as their grand-parents. This alternation of generations, or *metagenesis,* with its attendant parthenogenesis (or birth from virgins) in every second generation, goes on for nine or ten generations, by which time the season is over. The last aphides of the year are fully formed and winged, and deposit eggs, which are hatched in spring.

aphis-sugar, *s.* Honey-dew, the honey-like substance secreted by aphides. [APHIS, HONEY-DEW.]

Draw lines of different colours round the different counties of England, and then cut out each separately, as in the common play-maps that children take to pieces and put together, so that each district can be contemplated apart from the rest, as a whole in itself. A. *In the Early Christian Church:* (1.) Books published anonymously. (2.) Those suitable for private rather than public reading. (3.) Those written by an apostle or other inspired author, but not regarded as part of Scripture. (4.) The works of heretics.

B. *In English now:*

I. *Literally:*

1. *Spec.:* The following fourteen books:

I. 1 Esdras; II. 2 Esdras; III. Tobit; IV. Judith; V. Additions to Esther; VI. The Wisdom of Solomon; VII. Ecclesiasticus, called also the Wisdom of Jesus, the son of Sirach; VIII. Baruch; IX. The Song of the Three Holy Children; X. The History of Susanna; XI. Bel and the Dragon; XII. The Prayer of Manasseh, King of Judah; XIII. 1 Maccabees; and XIV. 2 Maccabees.

Most of the above-mentioned books were composed during the two centuries immediately preceding the birth of Christ, though some were penned, or at least interpolated, at a later period. They were written not in Hebrew or Aramæan, but in Greek; and the Jews never accorded them a place in the Old Testament canon. They were inserted in the Septuagint, and thence passed to the Latin Vulgate. The Christian fathers were divided in sentiment as to their value and the relation they stood to the canonical Old Testament books; Jerome dealing with them in a free, enlightened, and discriminating manner; whilst Augustine and others were much less independent. The question whether or not they were inspired remained an open one till the Reformation. Wickliff, whose mind was cast in what we should now call a wonderfully Protestant mould, was against them; so was Luther: and yet more strongly, Calvin, with his followers. To uphold their waning authority, the Council of Trent, on the 8th of April, 1546, placed them on an equal level with Scripture, anathematising all who held the contrary opinion. Portions of them are in the New as well as in the Old Lectionary of the English Church; but the sixth of the Thirty-nine Articles explains that "the other Books" [the fourteen enumerated], "as Hierome saith, the Church doth read for example of life and instruction of manners, but yet doth it not apply them to establish any doctrine." The Westminster Confession of Faith regards them as simply human writings, and denies them all authority. The several apocryphal books are of unequal merit. 1st Maccabees is a highly valuable history; while Bel and the Dragon is a monstrous fable. Taking them as a whole, they throw much light on the religious opinions and the political state of the Jews before the advent of Christ, and explain not a little which else would be obscure in the New Testament.

"We hold not the *Apocrypha* for sacred, as we do the holy Scripture, but for human compositions."—*Hooker.*

2. *Gen.:* Any productions of similar character to the apocryphal books of the Old Testament. Writing regarding gospels of this nature, Strauss says—

"In several *apocryphas* . . ."—*Strauss: Life of Jesus* (Transl.), vol. i. (1846), p. 209.

II. *Fig.:* Untrustworthy statement, myth, fable.

". . . the *Apocryphal* Books which are usually printed between the Old and New Testaments."—*Hartwell Horne: Introd. to Study of Scripture* (1825), vol. iv., 214, note.

¶ *Apocryphal Controversy:* A controversy which arose about 1821, as to whether the Bible Society were acting rightly in binding the Apocrypha between the two Testaments of the Bibles which they issued, this practice having been adopted in order to render the sacred volume more acceptable in Roman Catholic countries or districts. The anti-Apocryphal party ultimately prevailed over their opponents. About 1826 the Apocrypha was altogether excluded from the Society's Bible. [APOCRYPHA.]

2. Of doubtful authority; mythic, fabulous.

"The passages to which it refers, are however in part from *apocryphal* or fictitious works."—*Lewis: Early Rom. Hist.*, ch. iii., § 2, vol. i., p. 73.

B. *As substantive:* One of the fourteen books named under APOCRYPHA, B., I. 1., or any literary production of similar pretensions and character.

ăp-ŏ-çў-nā′-çē-æ, *s. pl.* [APOCYNUM.] An order of plants, the English Dog-banes. Lindley places them under his Gentianal alliance, and the Asclepiadaceæ, or Asclepiads, under his Solanal one, thus separating two orders which in nature are closely akin. Both have monopetalous corollas, with five stamens, the fruit in follicles, and the juice milky; but they differ in the details of the sexual apparatus. In 1846, Lindley estimated the known species of Apocynaceæ at 566, since increased to about 600. Of 100 known genera only one, Vinca, occurs in Britain; the rest inhabit warmer countries than ours.

2. The second order of the class Amphibia, or Batrachia. The body is like that of an earthworm, and is quite destitute of feet. The order contains but one family, the Cæciliadæ (q.v.).

3. According to Professor Müller, a group of fishes belonging to the sub-order Physostomata. It is so called because the ventral fins are wanting. It contains three families, the Murænidæ, or Eels, the Gymnotidæ, and the Symbranchidæ.

Gram.: The chief clause in a conditional sentence, that intimating the consequence which will ensue if the condition expressed in the subordinate clause which preceded it, called the protasis, be realised. In the sentence, "If ye shall ask anything in my name, I will do it" (John xiv. 14), the *protasis* is, "If ye shall ask anything in my name," and the *apodosis*, "I will do it." Some grammarians extend the terms *protasis* and *apodosis* to antecedent and consequent clauses, even when the sentences to which they belong are not conditional.

"... it is observed by Jarvis that the Apostle has put only two members of the comparison, when there should properly have been four, omitting one in the *protasis* and another in the *apodosis*."—*Bloomfield: Greek Test.* (1841); *Comment on Rom.* vi. 4.

1. *Astron.:* The point in the orbit of any planet at which it is the greatest distance from the earth. When a corresponding term was introduced by the ancients, they proceeded on the supposition that the earth was the centre of the solar system, and therefore measured from it. The sun, therefore, was at a certain time said to be in apogee. The term is still used, but in general it is more correctly stated, not that the sun is in apogee, but that the earth is in aphelion [Aphelion]; in other words, measurement is made from the sun as the centre, not from the earth. The moon, again, being the satellite of the earth, is appropriately said to be at a certain time in apogee. The lunar apogee circulates in about nine and a half years.

Ą-pŏl-lĭn-ā'-rĭ-ąns, Ą-pŏl-lĭn-ā'-rĭsts, *s. pl.* [From Apollinaris the Younger, Bishop of Laodicea in the latter part of the fourth century.] The followers of the Apollinaris mentioned above, who contended for the divinity of Christ against the Arians, but taught that Christ assumed only a human body endowed with a sentient, but not an intellectual, soul. He believed that the divine nature in Christ supplied the place of a rational human soul. His views seem to have tended in the direction of those afterwards held by Eutyches. They were condemned by the Council of Constantinople in A.D. 381.

THE APOLLO BELVEDERE.

The Apollo Belvedere: A celebrated statue of Apollo, so called from having been placed in the Belvedere of the Vatican by Pope Julius II. It was found in the ruins of ancient Antium, now *Capo d'Anzo*, about the end of the fifteenth or the beginning of the sixteenth century, and was sculptured probably about the time of Nero. Byron gives a beautiful description of this famous statue in *Childe Harold*, iv, 141–163.

It was so constructed that it might be self-acting, or might be played upon in the usual manner by means of keys.

ăp'-ŏl-ŏgue, *s.* [In Ger. *apolog*; Fr. *apologue*; Sp., Port., & Ital. *apologo*; Lat. *apologus*; from Gr. ἀπόλογος (*apologos*) = (1) a long story, a tale; (2) a fable, like Æsop's; (3) an account: Gr. ἀπό (*apo*) = from, and λόγος (*logos*) = . . . discourse; meaning that an apologue is a discourse drawn from (a fable).] A fable designed to convey to, and impress upon, the mind some moral truth. It resembles a parable, but differs in this respect, that, whereas the event narrated in the parable is within the limits of probability, and might have happened, if indeed it has not actually done so, the apologue is bound by no such restraints; it can draw for its speakers and actors on the brute creation, or even on inanimate nature. The prodigal son (Luke xv. 11—32) and the ewe lamb (2 Sam. xii. 1—14) are properly parables; whilst the story of the trees electing a king (Judg. ix. 7—20) is an apologue.

"The Senate having decided in favour of a conciliatory course, sent Menenius Agrippa as their envoy to the seceders, who addresses to them the celebrated *apologue* of the Belly and the Limbs."—*Lewis: Early Rom. Hist.*, ch. xxi., pt. i., § 16.

"Why may not a sober *apologer* [apologuer] be permitted, who brings his burthen to cool the conflagrations of fiery wits?"—*Waterhouse: Apology for Learning, &c.* (1653), p. 258.

ą-pŏl'-ŏ-ĝў, * **ą-pŏl'-ŏ-ĝĭe,** *s.* [In Fr. *apologie*; Sp., Port., Ital., & Lat. *apologia*; Gr. ἀπολογία (*apologia*) = a defence, a speech in defence: ἀπο (*apo*) = from, and λογος (*logos*) = a word, language, . . . discourse; λέγω (*legō*) = . . . to speak.]

† **1.** The act of making a defence against an accusation; vindication, without its being implied that in this there is anything hollow or unsatisfactory; also the defence made.

¶ Used specially of the defence of Christianity and its professors, against opponents and calumniators, made by several of the early Fathers. Thus, Justin Martyr wrote two "Apologies"—one about A.D. 150, and the other after 160; Athenagoras one in 177, and Tertullian in 198; as did Melito, Quadratus, Militiades, Aristides, and Tatian in the same century. Many works of a similar character were subsequently published, though not always, or even generally, under the same title. Various modern writers have used the term *Apology* in the old sense; thus, Bishop Richard Watson was author of an "Apology for Christianity," and an "Apology for the Bible." So also the department of theology once generally termed "Evidences of Christianity" is now technically denominated *Apologetics* (q.v.).

"We have, among other works of his [Justin Martyr's], two *Apologies* for the Christians."—*Mosheim: Church Hist.*, Cent. i., pt. ii., ch. ii., § 5.

2. An admission of a fault; generally one of no great magnitude, for which this slight humiliation is held sufficient to atone. Sometimes it is so small that the apology for it approaches a full vindication, and sometimes, as in cases of libel, so grave that, even when the apology is accepted, the whole expenses of the trial-at-law are cast on the person who acknowledges himself to have erred.

¶ Crabb considers that "there is always some imperfection, supposed or real, which gives rise to an *apology*;" that "a *defence* presupposes a consciousness of innocence more or less;" that "a *justification* is founded on the conviction not only of entire innocence, but of strict propriety;" that "*exculpation* rests on the conviction of innocence with regard to the fact." "*Excuse* and *plea* are not grounded on any idea of innocence; they are rather appeals for favour resting on some collateral circumstance which serves to extenuate: a *plea* is frequently an idle or unfounded *excuse*, a frivolous attempt to lessen displeasure." He adds that "*Excuse* and *plea*, which are mostly employed in an unfavourable sense, are to *apology*, *defence*, and *exculpation*, as the means to an end; an *apology* is lame when, instead of an honest confession of an unintentional error, an idle attempt is made at *justification*; a *defence* is poor when it does not contain sufficient to invalidate the charge; a *justification* is nugatory when it applies to conduct altogether wrong; an *excuse* or a *plea* is frivolous or idle, which turns upon some falsehood, misrepresentation, or irrelevant point." (*Crabb: Eng. Synonyms.*)

Logic (*Ht.* = from that which is after): An argument which reasons backward from effects to causes, from observed facts to the law of nature which explains them, or in some similar way. If one infer, from marks of design in nature, that there must be a Designer, the argument is one *à posteriori.* It is opposed to the *à priori* argument, which more ambitiously attempts to reason out new facts from previously ascertained laws of nature, or from abstract conceptions. Though this latter process will sometimes brilliantly anticipate discovery, yet it is liable to lead one astray; and the immense advance made during the last two centuries by physical science has arisen mainly from its resolute adherence to the *à posteriori* method of reasoning. A. *Ordinary Language:*

1. *Lit.:* The official designation of twelve or (Paul included) of thirteen men, appointed by Jesus as His messengers, deputies, envoys, or ambassadors to the world. The Greek word ἀπόστολος (*apostolos*) occurs in a more general sense in various passages of the New Testament: as in John xiii. 16, where it is rendered, "he that is sent;" and in Philipp. ii. 25, and 2 Cor. viii. 23, where it is translated "messenger." In an ambiguous passage in Rom. (xvi. 7) the English word *apostle* may possibly be used in the same sense: "Salute Andronicus and Junius my kinsmen, and my fellow-prisoners, who are of note among the apostles." Probably, however, the meaning is not "which apostles are of note," but "who are highly regarded among or by the apostles." Of the thirteen, twelve were designed specially for the Jews, and the remaining one, the most distinguished and successful of the whole, for the Gentiles. The twelve seem to have had but little culture in their early life; but Paul had the highest education which the age could afford. Among the special qualifications of an apostle, one was that he must have been an eye and ear witness of the miracles and teaching of Christ from the commencement to the close of His ministry (John xv. 27; Acts i. 21, 22); or, at the very least, must have seen Him once with the bodily eyes (1 Cor. ix. 1; xv. 8, 9). Another was, that he must have been divinely called to the high office he was to fill (Matt. x. 1—42; Mark i. 16—20; ii. 14; iii. 14; Luke v. 27; vi. 13; Acts i. 24—26; 1 Cor. i. 1; Gal. i. 1, &c.). The power of working miracles, though not confined to the apostles, also went far towards proving apostleship (see 2 Cor. xii. 12, &c.). The special work of the apostles was to be "ambassadors for Christ" (2 Cor. v. 20), and to teach [Gr. μαθητεύσατε (*mathēteusate*) = make disciples of] all nations, baptising them in [Gr. εἰς (*eis*) = into] the name of the Father, the Son, and the Holy Ghost. With this commission a promise was given them of the presence and guidance of their Divine Master through all succeeding time (Matt. xxviii. 19, 20).

> "The *apostel* Poule unto the Romayns writeth . . ."—*Chaucer: The Tale of Melibeus.*

> "And when it was day, he called unto him his disciples; and of them he chose twelve, whom also he named *apostles.*"—*Luke* vi. 13.

Apostles' Creed. The well-known creed beginning, "I believe in God, the Father Almighty," and ending with the words "the life everlasting. Amen." For many centuries it was attributed to the Apostles, but historical criticism has shown that it arose some time after their age, and probably not all at one period. Plural. Church Hist. [APOSTOLICI.]

Apostolic Canons. Eighty-five ecclesiastical laws, the compilation of which was fraudulently attributed to Clement of Rome. They were brought together subsequently to his time, but give valuable information regarding the discipline of the Greek and other Oriental churches in the second and third centuries. (*Mosheim: Ch. Hist.*, Cent. i., pt. ii., ch. ii., § 19.)

Apostolic Churches. Churches first established by the apostles, specially those of Rome, Alexandria, Antioch, and Jerusalem. Afterwards the term obtained a less precise meaning.

Apostolic Constitutions. Certain voluminous directions regarding ecclesiastical discipline and worship; also fraudulently attributed to Clement, but which did not obtain their final form till about the fourth century. (*Mosheim: Ch. Hist.*, Cent. i., pt. ii., ch. ii., § 19.)

Apostolic Fathers. Those Christian fathers or writers who lived so early that they had opportunities of holding intercourse either with the apostles or their immediate disciples. They were Clement of Rome (Clemens Romanus), Ignatius, Polycarp, Barnabas, and Hermas. (*Mosheim: Ch. Hist.*, Cent. i., pt. ii., ch. ii., §§ 20, 21.)

apostolic succession. The claim made by most episcopally-ordained clergymen and bishops that they constitute links in an unbroken chain of similarly ordained persons, the first of whom were set apart to their sacred functions by the Apostles themselves. Those who hold that view most tenaciously generally combine with it the opinion that only clergymen who are in the line of this spiritual succession are entitled to the pastoral office in the Christian Church, all others simply usurping the functions of the ministry.

Or the rhetorical apostrophe may be from ἀπό (*apo*) and στροφή (*strophē*) = a turning; στρέφω (*strephō*) = to turn.]

A. *In the forms* apostrophe *and* * apostrophy:

Rhetoric: A figure of speech by which, according to Quintilian, a speaker turns from the rest of his audience to one person, and addresses him singly. Now, however, the signification is wider, and is made to include cases in which an impassioned orator addresses the absent, the dead, or even things inanimate, as if they were present and able to hear and understand his words. When Jesus, in the midst of an address to his apostles in general, suddenly turned to Peter and said, "Simon, Simon, behold, Satan hath desired to have you, that he may sift you as wheat" (Luke xxii. 24—37), the apostrophe was in the Quintilian sense. The following are examples of the same figure in the wider meaning:—

(*a*) Living, but absent.

"'Tis done—but yesterday a king,
And arm'd with kings to strive—
And now thou art a nameless thing,
So abject, yet alive."
Byron: Ode to Napoleon.

(*b*) Dead.

"My mother, when I learn'd that thou wast dead,
Say, wast thou conscious of the tears I shed?"
Cowper: On Receipt of my Mother's Picture.

(*c*) Inanimate.

"Why leap ye, ye high hills?"—*Ps.* lxviii. 16.

B. *In the forms* apostrophe *and* * apostrophus:

1. *Gram.*: The substitution of a mark like this (') for one or more letters omitted from a word, as *tho'* for *though*, *'Twas* for *It was*, *king's* for *kinges*. (See No. 2.)

2. The mark indicating such substitution, especially in the case of the possessive. The old possessive singular was *es*, and the apostrophe stands for the omitted *e*. Thus Chaucer has the "Knightes," the "Monkes," and the "Clerkes" Tales, for what now would be written the "Knight's," "Monk's," and "Clerk's" Tales. The old spelling is preserved in the word Wednesday = Wodenes day = Woden's day. The name *apostrophe* is given also to the mark in the possessive plural, as *brethren's*, *assassins'*.

"Many laudable attempts have been made by abbreviating words with *apostrophes*, and by lopping polysyllables, leaving one or two words at most."—*Swift.*

¶ Two apostrophes (") are usually employed to mark the ending of a quotation, the commencement of the quotation being indicated by inverted commas (‘‘); thus—

The Mosaic narrative commences with a declaration that "In the beginning God created the heaven and the earth."—*Buckland: Geol.*, vol. i., p. 20.

More rarely only one is used, thus—

The note of interrogation must not be used after *indirect* questions; as, 'he asked me who called.'—*Bain: Eng. Gram.* (ed. 1874), p. 203.

When there is a quotation within a quotation, one apostrophe is generally employed, thus—

"I say that the Word of God containeth whatsoever things may fall into any part of man's life. For, as Solomon saith in the second chapter of the Proverbs, 'My son, if thou receive my words,' &c., 'then thou shalt understand justice and judgment, and equity, and every good way.'"—*T. C.*, quoted in Note to *Hooker's Eccles. Pol.* (ed. 1841), p. 232.

ăp-ŏs-trŏph´-ĭc, *a.* [Eng. *apostrophe*; *-ic.*]

1. Pertaining to the rhetorical figure denominated an apostrophe.

2. Pertaining to an apostrophe. (Used in grammar and in poetry in lieu of a letter or letters omitted.) (*Murray.*)

ą-pŏs-trŏ-phīze, *v.t. & i.* [Eng. *apostroph(e)*; *-ize.* In Fr. *apostropher*; Port. *apostrophar*; Ital. *apostrofare.*]

A. *Transitive:*

1. To address one or more persons after the manner of a rhetorical apostrophe; to turn from an audience in general to a single person in it; or to address the absent, the dead, or things inanimate as if able to listen to one's impassioned words.

"There is a peculiarity in Homer's manner of *apostrophizing* Eumæus, and speaking of him in the second person: it is generally applied only to men of account."—*Pope.*

2. To omit a letter or letters from a word, or mark that such an omission has taken place by inserting an apostrophe. (*Webster.*)

B. *Intransitive:* To use the rhetorical figure called *apostrophe.*

". . . the learned world *apostrophizing* at my untimely decease. . . ."—*Goldsmith: The Bee*, No. iv.

". . . the common drugs with which every *apothecary* in the smallest market town was provided . . ."—*Macaulay : Hist. Eng.*, chap. xv.

¶ *Apothecaries' Company :* One of the Corporations of the City of London. On the 9th of April, 1606, the apothecaries of that locality were incorporated by James I., being united with the grocers. In 1617, a new charter set them free from this unnatural association. Towards the end of the seventeenth century many of the apothecaries began to practise as medical men in addition to selling medicine—an innovation, of course, stoutly resisted by regular physicians ; and about a century later they had themselves to stand on the defensive against similar procedure on the part of the recently arisen chemists and druggists. Various Acts of Parliament subsequently increased the power of the Apothecaries' Company, till in 1815 they obtained the formidable privilege of examining and licensing all apothecaries and sellers of drugs throughout England and Wales. With the important exception of their antagonists, the chemists and druggists, no medical man could now make or dispense drugs without the licence of the Apothecaries' Company. The Medical Act of 1858 and the Pharmacy Act of 1868 gave increased privileges to apothecaries, the latter one allowing them to charge both for medicine and for attendance. In America there is no body strictly analogous to the apothecaries of England.

I. *Literally :*

1. Properly, lands assigned as portions to the younger sons, or sometimes the brothers of the French king, who in general took their titles from the appanages which they held. Under the first two dynasties of French kings, the sons of the monarch divided his dominions among them. Afterwards the kingdom was assigned to the eldest, and appanages to the others. Then the dominant power of the latter princes was so circumscribed that their appanages could not be willed away to any one, or descend to females, but, on the failure of male issue, were made to revert to the crown ; and finally, on the 22nd of November, 1790, the power hitherto possessed by the crown of granting appanages was taken away, and provision made for the younger sons of the royal family by grants from public funds. During the earlier period of the existence of French appanages, they were divided into *royal* and *customary* ; the former being those granted to the king's brothers, and not allowed to be possessed by, or descend to, females ; and the latter granted to the king's sisters, and consequently under no such restriction.

"It has been before remarked, that the French noblesse became at an early period divided into the greater and the less, the former possessing territories, *apanage*, sovereignty, almost independent power."—*Evans Crowe : Hist. France* (ed. 1836), vol. i., p. 165.

Path.: Inflammation of the vermiform appendix of the cæcum, a worm-like, blind sac in the lower right side of the abdomen. The causes are various, exposure to cold or dampness, or some indiscretion in diet, being the most usual. In a large proportion of cases, foreign substances are an active factor in the production of the disease when a catarrhal condition of the mucous membrane already exists. In the absence of this condition, foreign bodies may remain and cause little or no disturbance; but should the membrane become inflamed, they add to the irritation by occluding the lumen of the appendix, thus favoring ulceration of the walls, perforation, and even gangrene of the whole organ. Catarrhal inflammations of the appendix are common and frequently chronic, but have not heretofore been recognized as appendicitis. [See TYPHLITIS, PERITYPHLITIS]. Several forms of this disease are now recognized, as acute, chronic, and recurrent; also rheumatic appendicitis, which is observed in cases presenting a rheumatic diathesis. Acute, severe attacks occur when the *bacillus communis coli* is present in a virulent form, and if this condition be associated with a fæcal concretion or other foreign body causing pressure, there is imminent danger of necrosis, perforation, and death. The symptoms of appendicitis are intense, cramp-like pains, which may not at first be located in the right iliac fossa; nausea, if not vomiting; rigidity of the abdominal walls, especially of the right side and before the pain localizes itself; constipation generally, but diarrhœa occasionally; intense thirst; a disposition to flex the thighs upon the abdomen; and extreme tenderness at the seat of the disease. The inflamed appendix may generally be felt by deep palpation. Extreme local tenderness at this spot is a valuable diagnostic sign distinguishing appendicitis from general peritonitis. In moderately severe cases pulse-rate and temperature are not seriously affected, but a sudden fall in temperature often indicates perforation and is therefore a suspicious symptom. Medical treatment frequently affords relief, but many practitioners recommend excision of the appendix as the only radical cure, and also as a preventive. This operation is now performed with great success, the rate of mortality being only two or three per cent., exclusive of cases in which surgical interference is made during an acute attack, when the mortality is much larger—perhaps 15 to 20 per cent. Complete natural obliteration of the lumen of the appendix has been observed, resulting in a spontaneous and permanent cure. [See VERMIFORM APPENDIX.]

To take the bend his *appetites* ordain."
Cowper: Hope

¶ Hooker thus distinguishes between Appetite and Will:—". . . the Will, properly and strictly taken, . . . differeth greatly from that inferior natural desire which we call *Appetite*. The object of *Appetite* is whatsoever sensible good may be wished for; the object of *Will* is that good which Reason doth lead us to seek. Affections, as joy, and grief, and fear, and anger, with such like, being, as it were, the sundry fashions and forms of *Appetite*, can neither rise at the conceit of a thing indifferent, nor yet choose but rise at the sight of some things. Wherefore it is not altogether in our power, whether we will be stirred with affections or no: whereas actions which issue from the disposition of the Will are in the power thereof to be performed or stayed. Finally, *Appetite* is the *Will's* solicitor, and the *Will* is *Appetite's* controller; what we covet according to the one, by the other we often reject; neither is any other desire termed properly Will, but that where Reason and Understanding, or the show of Reason, prescribeth the thing desired." (*Hooker: Eccles. Pol.*, bk. i., ch. vii., § 3.)

1. A well-known fruit; also the tree on which it grows. The fruit is that of the *Pyrus malus*, or Crab Apple, when modified and improved by long cultivation or grafting. [APPLE-TREE.] The apple was known to the classical nations of antiquity, the Greeks calling it μῆλον (*mēlon*), Doric μᾶλον (*malon*), and the Latins *malum*. These words, however, with the analogous Latin one, *pomum*, were properly generic terms, comprehending several kinds of fruit. The varieties of the apple amount to thousands rather than hundreds, and they may be multiplied almost indefinitely by artificially applying the pollen of one to the stigma of another. Besides being common in gardens, the apple is cultivated in orchards, which are specially numerous in the northern part of the United States and in Southern Canada. It is generally propagated by being grafted on crab-stocks.

It produced great jealousy among the female deities, of whom three—Juno, Minerva, and Venus—contended for it, the last-named being the successful competitor.

Examples: "She walks a queen," "It is I," "Hamlet, Prince of Denmark." In these sentences *queen* is in apposition with *she*, *I* with *it*, and *Prince* with *Hamlet*. *She*, *I*, and *Prince* are all in the nominative case.

Similar appraisement took place when the goods of a transgressor against the laws were forfeited and his goods secured for the public use, even if he had personally escaped the reach of justice. (*Blackstone: Comm.*, bk. iii., ch. 17.)

ap-prē'-ṣĭ-a-ble (or **cĭ = shĭ**), *a.* [In Fr. *appréciable.*]

1. Capable of being estimated and its value ascertained.

(*a*) Used in a general sense.

"Equally conclusive and more readily *appreciable* proof . . ." *Owen: British Fossil Mammals and Birds*, p. xxiii.

(*b*) Used specially of a quantity which, though small, is yet large enough to enable it to be ascertained, or at least estimated.

". . . the derivative oscillation (as it may be termed) will be imperceptible in one case, of *appreciable* magnitude in another, . . ."—*Herschel: Astron.*, 5th ed. (1858), § 650.

2. To estimate anything, even though the element of price enter into it only remotely; to comprehend, to understand, accurately to conceive.

". . . to enable us to *appreciate* the action of an organ in health."—*Todd & Bowman: Physiol. Anat.*, vol. i., Introd., p. 31.

¶ (*a*) In the United States *appreciate* is used in two other senses: (1) *transitive* = to raise the value of; and (2) *intransitive* = to rise in value. (*Webster.*)

(*b*) Crabb considers that while *appraise* and *appreciate* both signify to value, *appraise* is used in a literal, and *appreciate* in a figurative, sense: one *appraises* goods, he *appreciates* and does not *appraise* the characters of men. To *estimate* a thing is to get the sum of the value by calculation: to *esteem* anything is to judge its actual and intrinsic value. *Estimate* is used either literally or figuratively; *esteem*, only in a moral sense: one *estimates* losses by fire, he *esteems* the character of a good man.

". . . a defective *appreciation* of colours."—*Herbert Spencer*, 2nd ed., vol. ii., p. 249, § 363, Note.

ap-prē'-ṣĭ-a-tōr-ў (or **cĭ** as **shĭ**), *a.* [Eng. *appreciate*; *-ory.*] The same as APPRECIATIVE (q.v.). (*Goodrich & Porter.*)

ăp-prĕ-hĕnd′, *v.t. & i.* [In Fr. *appréhendre & apprendre;* Sp. *aprehender;* Port. *apprehender, aprender;* Ital. *apprendere* = to learn, to conceive; Lat. *apprehendo* = (1) to seize, (2) to allege, (3) to comprehend: *ad* = to, and *prehendo* = to take hold of, to seize. This is from Lat. *præ* = before, and the same root which appears in A.S. *hentan, gehentan* = to take hold of, to pursue.]

A. *Transitive:*

I. *Of physical action:* To take hold of, to grasp, to seize; especially to seize a criminal with the view of bringing him to justice.

"There is nothing but hath a double handle, or at least we have two hands to *apprehend* it."—*Taylor.*

"And when he had *apprehended* him, he put him in prison, . . ."—*Acts* xii. 4.

II. *Of mental action:* To seize, grasp, or lay hold of an idea or a conception; to entertain an emotion.

1. *Of mental conceptions:*

(*a*) To interpret, to understand but somewhat doubtfully.

"What was spoken metaphorically may be *apprehended* literally. What was spoken ludicrously may be *apprehended* seriously."—*Macaulay: Hist. Eng.*, chap. v.

(*b*) To believe, to be of opinion.

". . . to do what they conscientiously *apprehended* to be wrong?"—*Macaulay: Hist. Eng.*, chap. xi.

2. *Of emotion:* To dread the approach of some evil; to look forward with anxiety to a coming event.

"Here, therefore, the opposition had more reason than the king to *apprehend* violence."—*Macaulay: Hist. Eng.*, chap. ii.

¶ In this sense it is sometimes used impersonally.

"It was *apprehended* that, if he were now armed with the whole power of the Crown, he would exact a terrible retribution for what he had suffered."—*Macaulay: Hist. Eng.*, chap. xiii.

B. *Intransitive:*

1. Partially to understand.

2. To think, conceive, entertain an opinion. (Generally followed by *that.*)

¶ (1.) *Apprehend* in the sense classed above as II., 1 (*a*) is a much weaker word than *comprehend.* Every one *apprehends* much which he does not *comprehend.*

(2.) When *apprehend* is used in the sense classed as No. II., 1 (*b*), it may be contrasted with the verbs to *conceive,* to *suppose,* and to *imagine.* According to Crabb, to *apprehend* is simply to take an idea into the mind, as children do; to *conceive* an idea is to form it after reflection, as is done by adults. To *apprehend* and to *conceive* are applied only to reality, whilst to *suppose* and *imagine* are used of things which may exist only in the imagination. *Apprehend* expresses the weakest kind of belief: a man is said to *conceive* that on which he forms a direct opinion; what one *supposes* may admit of a doubt, what one *imagines* may be altogether improbable or impossible, and that which cannot be *imagined* may be too improbable to be believed. (*Crabb: Eng. Synon.*)

(3.) When *apprehend* is used in the sense classed as No. II., 2, it may be contrasted with the verbs to *fear* and to *dread.* These rise above each other in force after the manner of a climax in the order *apprehend, fear, dread.* We *apprehend* an unpleasant occurrence; we *fear* a misfortune; we *dread* a calamity. Moreover, *apprehend* respects things only; *fear* and *dread* relate to persons as well as things. (*Crabb: Eng. Synon.*)

(4.) More (*Sleep of the Soul*, ii. 28) uses the form *apprend,* probably *metri gratia.*

ăp-prĕ-hĕnd′-ĕr, *s.* [Eng. *apprehend; -er.*] One who apprehends in any of the senses of that verb.

"Gross *apprehenders* may not think it any more strange, than that a bullet should be moved by the rarefied fire."—*Glanville.*

ăp-prĕ-hĕnd′-ĭng, *pr. par., a., & s.* [APPREHEND.]

A. *As pa. par. & adj.:* In senses corresponding to those of the verb.

B. *As substantive:* Apprehension.

". . . to issue a proclamation for the *apprehending* of Ludlow."—*Macaulay: Hist. Eng.*, ch. xv.

ăp-prĕ-hĕn′-sĭ-ble, *a.* [Lat. *apprehensibilis.*]

* **1.** Able to be comprehended or included; comprehensible, in a literal sense.

"The north and southern poles are incommunicable and fixed points, wherof the one is not *apprehensible* in the other."—*Browne: Vulgar Errours.*

2. Able to be apprehended, in a *lit.* or *fig.* sense.

". . . in reality it exacts so powerful an effort on the part of the reader to realise visually, or make into an *apprehensible* unity, the scattered elements and circumstances of external landscapes painted only by words . . ."—*De Quincey: Works* (ed. 1863), vol. ii., p. 173.

ăp-prĕ-hĕn′-sion, *s.* [In Fr. *appréhension;* Port. *apprehensao;* Lat. *apprehensio,* from *apprehensum,* supine of *apprehendo.*] [APPREHEND.]

I. The act or power of apprehending.

1. *Physically:* The act of laying hold of, grasping, or seizing with the hands or in some similar way, and especially of seizing a criminal to bring him to justice. [PREHENSION.]

"A lobster hath the chely or great claw of one side longer than the other, but this is not their leg, but a part of *apprehension,* whereby they seize upon their prey."—*Browne: Vulgar Errours.*

2. *Mental:*

(*a*) The act of mentally grasping or laying hold of, especially the act of laying hold of an idea without studying it in its various relations so as to comprehend it. [COMPREHEND.]

"Simple *apprehension* denotes no more than the soul's naked intellection of an object, without either composition or deduction."—*Glanville.*

"And acts in that obedience, he shall gain
The clearest *apprehension* of those truths,
Which unassisted reason's utmost power
Is too infirm to reach!"
Wordsworth: Excursion, bk. v.

(*b*) Opinion, belief, founded on sufficient or resting on doubtful evidence.

¶ The duration of apprenticeships varies in different countries, and has not been uniform in any country. Apprenticeships seem to have been unknown among the old Romans. In England they are incidentally mentioned in an Act of Parliament in 1388, but they were then so common that their origin must be sought at a long prior date. By the "Statute of Apprenticeship," 5 Eliz., c. 4, it was enacted that no person should for the future exercise any trade, craft, or mystery at that time exercised in England, unless he had previously served an apprenticeship to it of at least seven years. The judges of the higher courts of law gave as narrow an interpretation as they could to this repressive enactment. Adam Smith (*Wealth of Nations,* bk. i., ch. x., pt. ii., and bk. iv., ch. ii.) denounced it; and the Act 54 Geo. III., c. 96, swept it away. Optional apprenticeship still flourishes, and is the common method of learning a handicraft. The enforcement of apprenticeship was never carried out to the same extent in Ireland and in Scotland as in England. In the United States apprenticeship followed the English laws and custom. It has almost died out in the larger cities, but still exists in many small towns and villages. From these towns and from immigration the supply of skilled mechanics needed in the large cities is mainly derived

Gen.: One who appropriates anything.

II. Of either form.

Law: A spiritual corporation which has had annexed to it the tithes of a benefice; or the individual at the head of such a corporation. Also a layman who has such tithes transferred to him; but in this latter case the term commonly used is *impropriator*, meaning one who, not a sacred personage, *improperly* holds church funds or lands.

". . . a vicar has generally an *appropriator* over him, entitled to the best part of the profits, to whom he is in fact perpetual curate, with a standing salary."—*Blackstone: Comment.*, bk. i., ch. 2.

"Let me say one thing more to the *appropriataries* of benefices."—*Spelman.*

ap-prō'v-ą-ble, *a.* [Eng. *approve; -able.*] Able to be approved of, meriting approval.

"He seemed to seek in every eye

2. To prove.

† (*a*) To establish the truth of any proposition by reasoning; to attempt to show that it is worthy to be accepted; hence, to assent to it.

"In religion,
What damned errour, but some sober brow
Will bless it, and *approve* it with a text!"

† (*b*) To prove by actual experience, to test, to try, to show, to exhibit.

3. *Old Scottish Parliamentary usage:* To affirm by a parliamentary vote any question submitted for decision.

"The question was put according to the Scottish form, 'Approve or not *approve* the article?'"—*Macaulay: Hist. Eng.*, ch. xv.

B. *Intransitive:* To express or to feel approbation. (Generally followed by *of.* Milton put an infinitive after it, but this is now obsolete.)

To thy transgressions? and disturb'd the charge

ap-prôve-mĕnt, *s.* [Eng. *approve; -ment.*]

I. *Ordinary Language:*

1. The act of approving, approbation, approval; the state of being approved.

"It is certain that at the first you were all of my opinion, and that I did nothing without your *approvement.*"—*Haywood.*

* 2. Improvement. (II., *Law*, 1.)

II. *Law:*

1. The improvement of commons by enclosing a portion of them for purposes of husbandry.

"For it is provided by the Statute of Merton, 20 Hen. III., c. 4, that the lord may *approve*, that is, enclose and convert to the uses of husbandry (which is a melioration or *approvement*) any waste grounds, woods, or pastures, in which his tenants have common *appendant* to their estates; provided he leaves sufficient common to his tenants, according to the proportion of their land."—*Blackstone: Comment.*, bk. iii., chap. 16.

¶ Population in England being very much denser than when the Statute of Merton was passed, it is no longer taken for granted that the enclosure of a common, and especially of one situated near a large town, is an "approvement" (improvement), and there are now many legal pitfalls for a lord of a manor attempting, even with the sanction of the commoners, to enclose waste land.

† 2. The act of turning king's or queen's evidence. [APPROVER.]

* II. *Plural. King's approvers:*

1. Those who let the king's demesne in small manors.

2. Sheriffs. (*Stat.* 1 *Edw. III.*, c. 8.)

III. One who approves or appeals, that is, confesses a felony, at the same time betraying his accomplices, in the hope of obtaining pardon to himself. The reason why he is called *approver* (in Lat. *probator* = prover) is that he has to prove what he alleges. Any person whom he accuses is called an appellee. It is felony in a jailor to force a man to turn approver. (*Blackstone: Comment.*, bk. iv., chaps. 10 & 25.)

". . . his testimony would have far greater weight with a jury than the testimony of a crowd of *approvers* swearing for their necks."—*Macaulay: Hist. Eng.*, chap. xxi.

¶ An approver in this sense is called, as the case may be, king's or queen's evidence. Such testimony is eminently suspicious, and now-a-days requires to be independently corroborated.

"This gentleman kindly showed me the *approvers* or king's evidence of his establishment."—*Hooker: Himalayan Journals*, vol. i., p. 65.

ap-prô'v-ĭng, *pr. par.* [APPROVE.]

ap-pŭr'-tĕn-ançe, * **ap-pĕr'-tĕn-ançe,** *s.* [O. Fr. *apurtenaunce*; Fr. *appartenance*; Ital. *appartenenza.* From Lat. *appertinens*, pr. par. of *appertineo* = to belong to: *ad* = to, and *pertineo* = to hold through, to pertain to; *per* = through, and *teneo* = to hold.] That which belongs to any person or thing; that which, though perhaps loosely connected with another thing, still pertains to it, or is a part or an appendage of it. It is not settled that it came, as the Latin specific name would imply, from Armenia. It is wild in Africa and in the Caucasus, where the mountains in many places are covered with it; it is found also in China and some other countries. It was cultivated in England at least as early as 1562, and in Italy was known to Dioscorides early in the Christian era as the *Præcocca*. It is esteemed only second to the peach.

Opening month; the month in which plants open. But Sir Cornewall Lewis says: "The derivation of *Aprilis* from *aperire* overlooks the fact that with a year of 304 days, April would not always have been a spring month." Another etymology connects it with ἀφρός (*aphros*) = foam, from which Venus, to whom the month was sacred, was said to have sprung.] [APHRODITE.]

A. *As substantive:*

1. *Lit.:* In recent times the fourth month of the year, though when Aprilis was first introduced into Rome by the mythic Romulus it was the second. The Anglo-Saxons called it Easter-monath = Easter month. The legislature called it May."
Cowper: A Fable.

2. *Fig.:* The commencement of love; the springtide of affection.

ā pri-ō'r-i, *used as adj. or adv.* [Latin, literally = from that which is before. The *a*, though really Latin, is generally marked *à*, as if it were French.]

† **1.** *Logic:* Noting a method of reasoning from an hypothesis to its legitimate consequence, or from a known or imagined cause to an effect. It is essentially the same as deduction, whilst the *à posteriori* method is the equivalent of induction. *A priori* reasoning is quite trustworthy in mathematics; for the data being hypothetical, error cannot arise if the ratiocination be properly conducted. In metaphysics, intuitions assumed as the starting-point for reasoning rest on an *à priori* foundation. In natural theology we reason *à priori* when we infer the divine origin of the universe from the theory of an intelligent Creator; we reason *à posteriori* when we infer the existence of an intelligent Creator from the works of creation. [À POSTERIORI, DEDUCTION, INDUCTION.]

"For Alisaunder's gret *aprise*."
Alisaunder, 353.

ā'-prŏn, * **ā'-pĕrn,** * **nā'-prŭn** (*Eng.*), **nā'p-pĕrn** (*N. of Eng.*), *s.* [In Gael. *aparan*, *aiparan*; Ir. *aprun* (these three are from the English); Fr. *napperon* = a small table-cloth, put over the great one to protect the latter from stains (*Littré*); *nappe* = a table-cloth; Old Fr. *naperon*; Low Lat. *napa*, *nappa* = napkin. APSIDAL CHAPEL.
Church of St. Julien, Brioude, Auvergne.

1. Pertaining or relating to an architectural apse or apsis.

"Gloucester Cathedral crypt, with aisle and three radiating *apsidal* chapels."—*Gloss. of Arch.* (1850), p. 29.

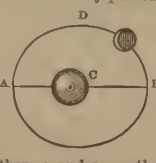
2. Relating to the apsides of the moon or of the primary planets.

ăp′-sĭ-dēs, *s. pl.* [APSE.] The plural of the form APSIS (q.v.).

I. *Generally.*

II. *Technically (Astron.):* The two points in the elliptic orbit of a planet where it is at the greatest and at the least distance respectively from the body around which it revolves. The moon moving in an elliptic orbit around the earth, which is situated in one of the foci, is at what was anciently called its higher apse when it is in apogee, and at its lower one when it is in perigee. Similarly, the primary planets, including the earth and comets, moving in elliptic orbits around the sun, which is situated in one of the foci, pass through their higher apse when they are in aphelion, and their lower one when in perihelion. It is the same with the satellites of Jupiter when they are in apojove and perijove.

Line of the apsides: The line connecting the two apsides of a primary or secondary planet. Were it not for a motion of the apsides, it would exactly coincide with the major or longer axis of the ellipse. Let A D B be the orbit of the moon, of which the eccentricity has been purposely exaggerated, and let C be the earth; then A and B are the two lunar apsides.



Progression of the moon's apsides: A slow movement in the position of the apsides of the moon, produced by the perturbing attraction of other heavenly bodies. It is about 3° of angular motion in one revolution of the moon, and in the same direction as her progression in her orbit. The apsides of the primary planets are also to a certain extent perturbed.

Revolution of the moon's apsides: The movement of the apsides around the entire circumference of the ellipse, which takes place in 3232·5753 mean solar days, or about nine years.

Libration in planetary apsides: A movement sometimes forward and sometimes backward in the apsides of Venus and Mercury, from perturbations caused by other heavenly bodies.

ăp′-sĭs, *s.* [APSE.]

Ornith.: A genus of swimming birds, classed by some under the family Alcidæ, and by others under that of Spheniscidæ. It contains the penguins of the Southern hemisphere. Their wings are rudimentary, with only vestiges of feathers, and their feet so far behind that when on shore they have to sit or stand bolt upright. When pursued, however, they can manage to make way quickly by using their wings as an anterior pair of legs. The water is their natural element, in which they live, and they move in it with much agility. Example, *A. Patagonica*, a species as large as a goose, seen standing in large flocks on barren shores near the Straits of Magellan, and here and there as far as New Guinea.

ăp′-tĕr-a, *s. pl.* [Neut. plur. of Gr. ἄπτερος (*apteros*) = wingless: ἀ, priv., and πτερόν (*pteron*) = a wing; πέτομαι (*petomai*) = to fly.]

Zool.: Linnæus's name for his seventh and last order of Insecta. This order contained a heterogeneous assemblage of six-footed insects proper—spiders, crabs, and centipedes. Any entomologists who now retain it limit it to the wingless orders of insects proper—the Anoplura, the Mallophaga, the Thysanura, and the Aphaniptera, which, however, are now not placed in a single category, owing to the fact that the Aphaniptera differ from the rest in undergoing metamorphosis.

2. *Arch.:* Not having columns on the sides. (Used of temples or similar buildings.)

1. *Zool.:* Wingless.

ăp-tĕr-ўg′-ĭ-dæ, *s. pl.* [APTERYX.]

Zool.: A family of Cursorial Birds with some affinities to the Struthionidæ, or Ostriches, but differing in their lengthened bill, their short legs, their possession of a short hind toe, with a strong claw, and finally, by their wings being quite rudimentary.

ăp′-tĕr-ўx, *s.* [Gr. ἀ, priv., and πτέρυξ (*pterux*), genit. πτέρυγος (*pterugos*) = a wing.]

Zool.: A genus of birds, the typical one of the family Apterygidæ. Two species are known—the *A. australis* and *A. Mantelli*, both from New Zealand. The natives call the former, and probably also the latter, Kiwi-kiwi, which is an imitation of their peculiar

APTERYX.

cry. The *A. australis* is somewhat less in size than an ordinary goose. It runs when pursued, shelters itself in holes, and defends itself with its long bill; but unable as it is to fly, its fate, it is to be feared, will soon be that of the dodo—it will become extinct.

2. A division of the ecliptic—that between 300° and 330° of longitude, which, on account of the precession of the equinoxes, has gradually advanced from the constellation Aquarius, once within those limits. The sun enters this part of his course about the 21st of January, at which time there are generally copious rains in Italy, whence the name Aquarius = the water-bearer or waterman. (*Herschel: Astron.*, §§ 380, 381.) It is marked thus ♒.

A. *As substantive:* A kind of engraving so called from its resemblance to water-colour drawings. The most approved method of practising it is to first trace the outline of the proposed picture on a copper-plate by means of an etching needle or other sharp instrument. Next, the etching ground is removed, and the plate thoroughly cleaned with whitening and water. The plate is then placed in a flat tin or earthen vessel in an inclined position, and on it is poured a solution of resinous matter, prepared in rectified spirits of wine. When dry, the design is drawn upon it with the bursting-ground [BURSTING-GROUND], and the plate is varnished and dried. Some clear water is then applied to it, and finally, the design is bit into the copper by two successive applications of dilute nitric acid.

channel or conduit raised on pillars for the conveyance of drinking water to a city. Of all the nations of antiquity, the Romans were the great builders of aqueducts. No fewer than twenty of these erections converged on the

capital during its palmy days; whilst there were many more in the provincial parts of the empire. Magnificent ruins of some of these still remain: the best of them in the Campagna around Rome; the others, in portions of France, Spain, Italy, Sicily, Greece, Asia, and Africa, once occupied by important cities and towns. Aqueducts are rare in this country; the most notable one being the great aqueduct recently finished for the water supply of the City of New York.

A. *Ordinary Language:*

1. Consisting wholly or in large measure of water. [B. 1.]

2. Made by the addition of water.

3. Deposited from water. [B. 4.]

B. *Technically:*

1. *Meteorol. Aqueous vapour:* The water which, evaporating from the earth, goes to constitute clouds.

"The leaves of the plants absorb both the carbonic acid and the *aqueous* vapour of the air."—*Tyndall: Frag. of Science*, 3rd ed., iv. 87.

2. *Anat. Aqueous humour:* A humour of the eye filling up the space between the cornea and the crystalline lens. It is partially divided by the iris into an anterior and posterior chamber. The former is the larger, and has the cornea in front, the iris behind, and a portion of the ciliary ligament on its circumference.

"The *aqueous* humour of the eye consists very nearly of water. Berzelius states that all its other constituents taken together do not amount to so much as one fiftieth part of the whole. Of these, more than half is chloride of sodium, and the rest is extractive matter, soluble either in water or alcohol."—*Todd & Bowman: Physiol. Anat.*, vol. ii., p. 36.

3. *Chem.* [A. 2.]

4. *Geol. Aqueous rocks:* Rocks originally deposited from water, whence they are sometimes called *aqueous deposits*. As what is deposited is sediment of some one kind or other, they are also termed *sedimentary rocks*, and as, unless too much metamorphosed, they contain the now fossilised remains of the animals which lived in the water, and the plants which grew or were carried into it, they are denominated *fossiliferous rocks*. Finally, as the sediment successively deposited from the water tended to arrange itself in layers or strata, the rocks thus formed are called *stratified rocks*. (*Lyell: Geology.*) A great part of the science of geology has been built up on the careful study of aqueous rocks, the relative order of their disposition, and their fossil contents.

The species have not that strong tooth in their bills which the falcons possess, and are feebler for their size, less courageous and less predatory than the falcons proper. Two species occur in Britain. In the United States the Bald Eagle has been chosen as the national emblem.

There are three kinds of Arabesque: — 1st (and oldest), that of the Romans, without the animals. They occur in the mural paintings at Pompeii, Herculaneum, and other places. 2nd. That of the Arabs, also without the animals. This is well seen in the Alhambra. 3rd. The Christian Arabesque, with the figures introduced. "Gum *arabic*, or gum acacia, is an exudation from various species of acacia."—*Treas. of Bot.* (ed. 1866), ii. 5.

B. *As substantive:* The language of Arabia or of the Arabs. It is properly the dialect of the Koreishite tribe in Arabia, rendered classic by its being the language in which the Koran was composed. It is now vernacular in Arabia, Egypt, and Northern Africa, and the learned and sacred tongue of all Mohammedan countries. The numbers who at present speak it have been estimated at 100 millions, which is probably an exaggeration. Philologically viewed, Arabic is the most southerly of the Syro-Arabian family of languages, besides being itself the type of one of the three classes into which that leading family of tongues is divided. Associated with it in this relation are the living Amharic and the dead Ethiopic and Himyaritic tongues. About two-thirds of the Hebrew roots occur with slight modification in Arabic, which renders the language useful to the Biblical student, as its wide diffusion does to the missionary; while numerous chemical, alchemical, astronomical, and strological words which arose during the brilliant, but brief, period when the Saracens aimed at intellectual as well as political ascendancy, will always render it an object of interest to scientific men. The Arabic literature is posterior in date to the time of Mohammed.

The leaves are frequently cordate. The fruit is succulent, with many seeds. They are acrid in character, and often poisonous. The *Caladium Seguinum*, or Dumb Cane of the West Indies and South America, when chewed, causes the tongue so to swell as to cause temporary dumbness. In 1847, Dr. Lindley estimated the known genera at twenty-six, and the species at 170. There is one species in the British flora, the *Arum maculatum*, Cuckow-pint, Wake-Robin, or Lords and Ladies. [See ARUM.]

The *A. hypogæa*, or the underground Arachis [Gr. *ὑπόγειος* (*hupogeios*) = subterraneau], is so called because the legumes are produced and matured beneath the soil. The plant is believed to have come originally from Africa, but it is now cultivated in the warmer parts both of Asia and America. The legumes are eatable. The seeds have a sweet taste, and furnish a valuable oil used for lamps and as a substitute for olive-oil. In South Carolina they are employed for chocolate.

Zool.: The class of animals which contains Spiders, Scorpions, and Mites. It belongs to the Articulata or Annulosa, and the sub-class Arthropoda, and is appropriately placed between the Crustacea on the one hand, and the Insecta on the other. The highest Crustacea have ten feet, the Arachnida eight, and the Insecta six. The Arachnida are wingless, have no antennæ, breathe by means of tracheal tubes or pulmonary sacs performing the function of lungs. As a rule, they have several simple eyes. They have no proper metamorphosis. They live in a predatory manner. Cuvier divided the class into two orders: Pulmonariæ and Trachearіæ; that is, those breathing by lungs and those breathing by tracheæ. The former include the Spiders proper and the Scorpions; the latter, the Acari (Mites) and their nearer and more remote allies. Huxley separates the Arachnida into six orders: (1) Arthrogastra, including Scorpio, Chelifer, Phrynus, Phalangium, Galeodes, &c.; (2) Araneina, or Spiders; (3) Acarina, or Mites and Ticks; (4) Fresh-water Arctisca or Tardigrada, called Water-bears; (5) Pycnogonida (Marine animals); and (6) Pentastomida (Parasites).

Med.: Names given by Martinet to a formidable malady, the inflammation of the arachnoid. Sometimes the other membranes investing the brain are also affected, in which case the disease is termed Meningitis (q.v.). It is also apt to spread to the substance of the brain. Arachnitis and Meningitis are akin to apoplexy and cerebritis, from which, however, they may be distinguished by the absence of premonitory symptoms, by the occurrence of spasmodic and convulsive symptoms on both sides of the body, and by the presence of febrile excitement without decided paralysis, followed by collapse.

Zool.: An order of Arachnida. Huxley, adopting the term Araneina, makes it the second of the six orders into which he divides that class of animals. The Araneina have the abdomen unsegmented; it is, moreover, connected with the thorax by a narrow peduncle. They breathe by means of two or more pulmonary sacs and two stigmata connected with tracheæ. They have from four to six spinnerets for the exit of the silken threads whence their webs are spun. They are sometimes called Dimerosomata. Carpenter, Dallas, &c., divide them into three families—Araneidæ, Lycosidæ, and Mygalidæ (q.v.).

The highest part of the arch is called its *crown*, or by the old English authors the *scheme* or *skeen*, from the Italian *schiena*. The lowest voussoirs of an arch are called *springers*, and the central one which holds the rest together the *keystone*. The under or concave side of the voussoirs is called the *intrados*, and the outer or convex one the *extrados* of the arch. A chord to the arch at its lower part is called its *span*, and a line drawn at right angles to this chord, and extending upwards to its summit, is called its *height*.

The *impost* of an arch is the portion of the pier or abutment from which the arch springs. If the height of the crown of an arch above the level of its impost is greater than half the span of the arch, the arch is said to be *surmounted*. If, on the contrary, it is less, then the arch is said to be *surbased*.

The *curved* arch was known to the Assyrians and the Old Egyptians. Sir J. G. Wilkinson considers that it existed in brick in the reign of Amenoph I., about B.C. 1540, and in stone in the time of Psammetichus II., B.C. 600. The evidence is derived from the ruins of actual buildings, but paintings appear to carry the arch back to about 2020 B.C. There is no mention of the genuine arch in Scripture, the term "arches," in Ezek. xl. 16, being a mistranslation.

The arch was brought into extensive use by the Romans, and everywhere prevailed till the twelfth century A.D., when the arch pointed at the apex, and called in consequence the pointed arch—the one so frequently seen in Gothic architecture—appeared in Europe as its rival. The forms of both curved and pointed arches may be indefinitely varied. Of

HORSE-SHOE ARCH.

the former may be mentioned the *horse-shoe arch*, a name which explains itself, and the *foil* arch, from Lat. *folium* = a leaf, of which there are the *trefoil*, the *cinquefoil*, and the *multifoil* varieties, so named from the plants after which they are modelled.

Other arches are the *pointed* one; the *equilateral* one, when the centres of the circles whose intersection constitutes the pointed arch coincide with the angular points at the two sides of the base; the *lancet* arch, when the centres of the circles fall beyond these points; the *drop arch*, when they fall within the base; and the *segmented pointed arch*, the sides of which constitute segments of circles containing less than 180°. Besides these there are several other varieties of arch distinguished by their respective forms. (*Gloss. of Arch., &c.*)

Arches, Court of. [So named from the fact that it originally met in the church of St. Mary-le-Bow (Lat. *Santa Maria de arcubus*), literally, "of bows" or "arches," by which is meant that the roof or steeple was supported by arches. The name was retained after the court was removed, first to Doctors' Commons and then to Westminster Hall.] An ecclesiastical court of appeal for the Archbishopric of Canterbury. It has proper jurisdiction over thirteen "peculiar" parishes in London belonging to the Archbishop of Can-

Combined with it, or annexed to it, is the Court of Peculiars. The attentive reader of the Acts of the Apostles, noting that nearly the whole missionary energy of St. Paul was expended upon the cities and chief towns rather than on the villages and the country districts, will be prepared to learn that there were flourishing churches in the leading centres of population, whilst as yet nearly all other parts remained "pagan." [PAGAN.] So strong, however, was the evangelistic spirit prevailing that in due time every one of the first-formed churches was surrounded by a number of younger and less powerful congregations which it had called into being. The pastors of these new churches being called "bishops," that term no longer appeared a dignified enough appellation for the spiritual chief of the mother church, and about A.D. 340 the Greek title of ἀρχιεπίσκοπος (*archiepiscopos*) = Eng. *archbishop*, was introduced to meet the difficulty. Two archbishops figure at the Council of Ephesus, in 431, and in subsequent centuries the designation became common over Christendom.

In England the early British churches were, in large measure, swept away by the Anglo-Saxon invaders, who were heathens, and the country consequently required re-conversion. The great southern centre from which this was done was Canterbury, then the capital of Kent, where King Egbert gave Augustine, the chief missionary, a settlement. In the north, York, the chief town of Northumbria, where King Edwin built a shrine for Paulinus, became the great focus of operation for that part of England; hence the two archbishoprics now existing are those of Canterbury and

of York. The prelate who occupies the former see is Primate of all England, whilst his brother of York is only Primate of England, the superiority of the see of Canterbury, long contested by that of York, having been formally settled in A.D. 1072. The former is the first in dignity after the princes of the blood; the latter is not second, but third, the Lord Chancellor taking precedence of him in official rank. An archbishop is often called a Metropolitan. In the United States the Roman Catholic Church has twelve archbishops, but there are none in any of the Protestant churches.

"A secular assembly had taken upon itself to pass a law requiring *archbishops* and bishops, rectors and vicars, to abjure, on pain of deprivation, what they had been teaching all their lives."—*Macaulay: Hist. Eng.*, ch. xiv

"Several months were still to elapse before the *archbishopric* would be vacant."—*Macaulay: Hist. Eng.*, ch. xiv.

arch-chan'-cĕl-lŏr, *s.* [Eng. *arch*; *chancellor*. In Fr. *archichancelier*.] A chief chancellor. An officer of high rank who formerly presided over the secretaries of the court. Under the first two races of French kings, when their kingdom consisted of Germany, Italy, and Arles, there were three archchancellors—viz., the archbishops of Mentz, Cologne, and Treves.

"The seals of the triple kingdom were borne in state by the archbishops of Mentz, Cologne, and Treves, the perpetual *archchancellors* of Germany, Italy, and Arles."—*Gibbon: Decline and Fall*, ch. xlix.

arch-dăp'-ĭ-fĕr, *s.* [ARCHIDAPIFER.]

ar'ch-dēa-cŏn, * ar'che-dēkne (or **con = kn**), *s.* [Eng. *arch*, and *deacon*; A.S. *arcediacon*; Dan. and Ger. *arkidiaconus*; Dut. *aartsdeken*; Fr. *archidiacre*; Sp. *arcediano*; Port. *arcediago*; Ital. *arcidiacono*; Lat. *archidiaconus*; Gr. ἀρχιδιάκονος (*archidiakonos*); ἀρχι (*archi*) = chief, and διάκονος (*diakonos*) = deacon.] [DEACON.] A chief deacon. The first institution of deacons [Gr. διάκονοι (*diakonoi*) = servants, waiting-men, ministers, messengers] is recorded in Acts vi. They were elected to discharge such half-secular functions as raising and distributing alms to the poor, thus leaving the apostles free for purely spiritual work. It may be assumed that when meetings of the deacons took place, some one presided over them, and if this chairman was one of themselves, he would naturally be called in Greek ἀρχιδιάκονος (*archidiakonos*), in Eng. Archdeacon. The president of the deacons' meeting would require to be often in conference with the pastor; and when people meet, mind will affect mind, altogether apart from the relative dignity of the men brought in contact with each other. The archdeacon gradually gained in power, and, becoming what was called "the bishop's eye," was often dispatched on confidential missions to different parts of the diocese, there probably being about him a pliability wanting in the χωρεπίσκοποι (*chorepiscopoi*) = country, coadjutor or suffragan bishops. The survival of the fittest took place, and the archdeacon ended by superseding the more dignified but less bending functionaries. The same drama was re-enacted on English soil between the archdeacons and the rural deans, the latter, who were at first higher in position than their rivals, being now regarded as inferior to them in rank; an ordinary, or full dean, however, as contradistinguished from a rural dean, is admittedly superior to an archdeacon. The emoluments of the archdeaconates being but trifling, the occupants of the office generally hold also other preferments. They are empowered to hold a court, the lowest in the scale, from which there lies an appeal to the bishop of the diocese.

"They weren in the *archedeknes* book"

ar'ch-ĕr-ў, *s.* [Eng. *archer*; *-y*.]

1. The employment of the bow and arrows in battle, in hunting, or for other purposes. The art is of great antiquity. It is mentioned in Gen. xxi. 20, and in the Iliad and the Odyssey, besides being depicted on Egyptian monuments and Assyrian sculptures. The Philistines seem to have excelled in it, which caused David to issue orders that special instruction and training in it should be imparted to the Hebrews (2 Sam. i. 18). There were archers in both the Greek and Roman armies. In England, up to the time when gunpowder came into general use, the archers constituted some of the most formidable soldiers in the English army, several of the battles won over the Scots having been gained by their surpassing skill in the use of the bow. The weapon first employed was the arbalest, or cross-bow [ARBALEST]; afterwards the long bow supplanted it, the change taking place some time before the reign of Edward II. The Scottish "Royal Company of Archers" still claim the right of acting as the Sovereign's body-guard in Scotland; but, picturesque as they may look in a procession, it is to be hoped, both for their own and the monarch's sake, that they may never have to test the powers of their antique weapon against those of the breech-loading rifle.

When there the youthful Nortons met
To practise games and *archery*

A. *As adjective:* Pertaining to the Greek satiric poet Archilochus, who flourished about 700 B.C., or to the verse which he introduced.

B. *As substantive:* A kind of verse supposed to have been invented by the Greek poet Archilochus. The "Archilochius major" has seven feet, the first three dactyls or spondees, the fourth a dactyl, and the fifth, sixth, and seventh trochees, as—

Nūnc dĕcĕt | aūt vĭrī | dī nĭtī | dūm căpŭt
ĭmpĕ | dīrē | mўr | tŏ.
(*Horace*, Carm. I., iv. 9.)

The Archilochian minor has two dactyls and a cæsura, as—

Ārĭbŏrī | būsquĕ cŏ | mæ.
(*Horace*, Carm. IV., vii. 2.)

Horace varies these two metres in four different ways, called the first, second, third, and fourth Archilochian metres. The first consists of a dactylic hexameter combined with an Archilochius minor; the second of a dactylic hexameter with an iambelegus; the third of an iambic trimeter and an elegiambus; and the fourth of an Archilochius major, with a catalectic iambic trimeter.

1. The high priest of the Median or Persian Magi. The title was assumed by Darius Hystaspes.

2. Any magician or wizard; an enchanter.

¶ The term perpetually figures in Spenser's *Faerie Queene.* Some other writers have copied it from that work.

"'I will,' he cry'd, 'so help me, God! destroy
That villain *Archimage*."
Thomson: Castle of Indolence, ii. 32.

arch-ĭ-măn'-drīte, *s.* [In Russ. *arkhumandrum*; Ger. *archimandrit*; Fr. *archimandrite*; Sp., Port., Ital., & Lat. *archimandrita*; Gr. ἀρχιμανδρίτης (*archimandritēs*) = ἀρχι (*archi*) = chief, μάνδρα (*mandra*) = an enclosed space, . . . a monastery.] An Eastern abbot or superior of a monastery, especially one of the first order.

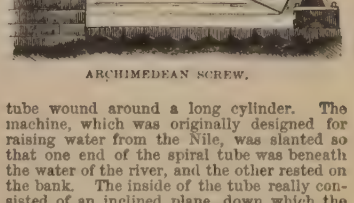
"His rival Eutyches was the abbot, or *archimandrite*, or superior of three hundred monks."—*Gibbon: Decline and Fall*, chap. xlvii., vol. iv., p. 353.

¶ Formerly it was used in a somewhat wider sense, being occasionally applied to archbishops.

Arch-ĭ-mē'-dē-ąn, Ar-chĭ-mē'-dĭ-ąn, *a.* [Eng. *Archimed(es); -ian.*] Pertaining to Archimedes, a celebrated mathematician of Syracuse, who lived in the third century B.C.

Archimedean principle, or Archimedean theorem; Archimedes's principle or theorem: It is that a body immersed in a liquid loses a part of its weight equal to the weight of the displaced liquid. It was by this law that he discovered the amount of alloy mixed in Hiero's crown. (*Ganot: Physics*, transl. by Atkinson, 3rd ed., 1868, § 104.) It holds good of gases as well as liquids properly so called. (*Ibid.*, § 168.)

Archimedean Screw, Archimedes's Screw: A *water-screw* or "*cochlion.*" *Cochlion* is from the Greek κοχλίον (*kochlion*) = a small snail, the shell of which it resembles, though it must be confessed very remotely, in being of a spiral form. It consisted of a spiral pipe or



ARCHIMEDEAN SCREW.

tube wound around a long cylinder. The machine, which was originally designed for raising water from the Nile, was slanted so that one end of the spiral tube was beneath the water of the river, and the other rested on the bank. The inside of the tube really consisted of an inclined plane, down which the water flowed, though to a superficial observer it seemed to flow up in contravention of the laws of gravity. It was, of course, unable to act if slanted to the water at too high an angle. It is now disused, one serious defect which it has being that it is apt to become clogged up with weeds, mud, stones, &c., which cannot easily be removed from a tube of spiral form.

2. Any sea agreeing with the former in containing many islands.

1. *Properly*, the art of building; *more specifically*, the art of building human habitations, temples, or edifices of any kind, whether humble or splendid. The term is generally, however, limited to the art of erecting edifices which, besides answering their primary purpose of utility, are fitted by beauty, by symmetry, and in other ways, to please the eye and gratify the mind. About half a century ago it was common to limit the signification still farther to buildings constructed after Greek or Roman models; but this unduly narrow meaning is now abandoned. Architecture, like other arts, carries out the principles of science, and must rest upon them. So continually, indeed, does it draw upon geometry, that it might almost itself be called a science. The architecture of a people is an index of their mental and moral qualities, and of the state of civilisation which they have reached. Fergusson considers it also more trustworthy than language in settling the question of race. The numerous styles of architecture, partly diverse, partly connected with each other, may be primarily divided into Ethnic and Christian. The following is a more minute classification:—In America two styles of architecture worthy of notice exist—the Mexican and the Peruvian. The Chinese have one in Eastern Asia. In India there are two totally distinct races—an Aryan one [Aryan], of which the Brahmans are the type, and a Turanian one, represented by the Tamuls of the Coromandel coast and Ceylon. The latter were the great builders. Fergusson recognises in India a Booddhist, a Jaina, a Southern Hindoo, a Northern Hindoo, a Modern Hindoo, and a Cashmerian style. In Western Asia there existed, at a more or less remote period, a Phœnician, a Jewish, an Assyrian, a Babylonian, a Persepolitan or Persian, and a Sassanian type of building; whilst in Europe there were Pelasgian or Cyclopean, Etruscan, and Druidical or Celtic types. A celebrated style commenced in Egypt as the Egyptian style; transferred to Greece, and modified there by Assyrian, it was called Grecian, and became a model for universal imitation. Adopted by the Romans, it was called Roman. Passing from them, it gave rise in one direction to the Saracenic, Arabian or Moresque, and in another to the Christian style, the latter with Romanesque, Gothic, and Byzantine sub-divisions. [Saracenic, Gothic, &c.]

The following are the leading styles of English architecture, arranged in the chronological order in which they flourished:—

	A.D.	A.D.
I. Norman	From	1066 to 1154.
II. Transition from this to the next, *i.e.*, from I. to III.	,,	1154 to 1189.
III. Early English . .	,,	1189 to 1272.
IV. Transition from III. to V.	,,	1272 to 1307.
V. Decorated	From	1307 to 1377.
VI. Transition from V. to VII.	,,	1377 to 1399.
VII. Perpendicular . .	,,	1399 to 1547.
VIII. Tudor	,,	1550 to 1600.
IX. Jacobean	,,	1603 to 1641.

Probably the finest display of architecture ever made was that of the Columbian World's Fair, at Chicago, in 1893.

¶ The subject now treated generally, called simply *Architecture*, is sometimes more precisely described as *Civil Architecture*, in which case there are at least two others, viz., *Military Architecture*, treating of the construction of fortifications, and *Naval Architecture*, the subject of which is the construction not merely of ships, but of harbours, docks, or aught else requisite to promote maritime enterprise. In this division the term *civil* is used vaguely, so as to include *Ecclesiastical Architecture*, but more frequently the two are made distinct.

2. The method of construction adopted in nature, which one insensibly compares or contrasts with the handiwork of man

Before the Aryans had finally separated, *riksha* = bright, applied to the plough-like constellation, had become obsolete, and the substantive *bear* remained, whence the constellation came to be called ἄρκτος (*arktos*) among the Greeks, *Ursa* among the Latins, and *Bear* among ourselves. (*Max Müller: Science of Language,* 6th ed., vol. ii., 1871, p. 393.).]

"Man has become a denizen of every part of the globe, from the torrid to the *arctic* zones."—*Owen: Classif. of the Mammalia*, p. 49.

Arctic Circle: A small circle of the globe, 23° 28′ distant from the North Pole, which is its centre. It is opposed to the Antarctic Circle, which is at the same distance from the South Pole. (*Glossog. Nov., &c.*)

Arctic Expedition: An expedition designed to explore the all but impenetrable regions surrounding the North Pole. The object with which these enterprises were commenced by the English was to obtain a passage by way of the Polar regions to India, Egypt being in Mohammedan hands, and fear, which now seems absolutely ludicrous, being felt that the Portuguese would successfully debar the English seamen from using the route by the Cape of Good Hope. When the utter hopelessness of finding either a north-western or a north-eastern passage to India though the Polar regions became apparent, it was felt that arctic expeditions might still profitably be sent out for purely scientific exploration, one main object now being to make as near an approach as possible to the pole. They have continued at intervals to our own times, chief among the most recent being those of Lieutenant R. E. Peary, of the U. S. Navy, and of Dr. Nansen. Around the respective opinions of these two explorers public interest in this question is mainly centered at present. On returning from his first expedition in September, 1892, Lieutenant Peary claimed to have found that at the 82nd parallel the Greenland coast turned South again, which, in his idea, forbade the possibility of a Polar current flowing down into the Greenland Sea. On the contrary, Dr. Nansen's theory is that the current which flows through Baffin's Bay and Smith's Sound does make its way to the North Pole, and that if a ship were once bedded in the ice and allowed to drift, she would be ultimately carried to the pole by this current. Whether the results of his search since July, 1893, are to prove less disappointing than those of our fellow-citizen is not yet known at the present date (April, 1896). An attempt to reach the North Pole by balloon has been in course of preparation for some time, the start being announced by the authorities at Washington for the month of July, 1896.

Arctic Fox (*Vulpes lagopus*): A species of fox found in North America within the Arctic Circle. It is blackish-brown in summer, but in winter has a long, thick white fur, which renders it a beautiful animal.

Arctic Pole: The North Pole as opposed to the Antarctic or Southern one. (*Glossog. Nov.*)

Arctic Zone: The zone or belt of the earth between the North Pole and the Arctic Circle.

There are several species, the *A. marmotta,* or Marmot, resident in the mountains of Europe and Asia [MARMOT], the *A. bobac* of Poland and Northern Russia, the *M. citillus,* the Zizel or Souslik, and several from America.

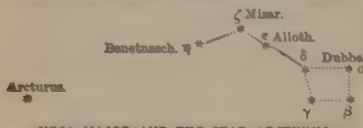
Arc-tū'-rŭs, *s.* [In Ger. *Arktur*; Fr. *Arcture, Arcturus*; Port. *Arturo*; Ital. *Arturo*; Lat. *Arcturus*; Gr. Ἀρκτοῦρος (*Arktouros*), from ἄρκτος (*arktos*) = bear, and -ουρος (*ouros*), a termination corresponding to *ward* in English, as θυρωρός (*thurōros*) = a door-ward, a doorkeeper. Hence *Arcturus* means bear-keeper.] (*Max Müller.*)

I. *Astronomy:*

1. A fixed star of the first magnitude, called also *a* Bootis. It is one of the very brightest stars in the Northern heavens. In March, 1635, Morin saw it in the west for more than half an hour after sunrise. To find it, draw a line through the tail of the Bear four times the length of the distance between the stars Mizar and Benetnasch in the diagram below. The ancients considered it a red star. Piazzi could not find it had any parallax. Though nominally "fixed," yet it has a proper angular motion of 2·250, equivalent to 53·32 miles in a second. In 752 years it altered its latitude 5′, and in twenty centuries, according to Humboldt, it has moved 2½ times the diameter of the moon's disc. In 1803, Herschel found its diameter, seen through a fog, $\frac{4}{10}$ of a second, from which he calculated its diameter to be not less than 8,000,000 leagues = 24,000,000 miles. (*Arago, Herschel, &c.*)

2. The *Arcturus of Scripture.* Heb. עָיִשׁ (*Ash*), Job ix. 9; עָיִשׁ (*Aish*), xxxviii. 32. Sept. Ἀρκτοῦρος (*Arktouros*); Vulg. *Arcturus.* Not the star now called *Arcturus*, which stands in solitary grandeur in the sky, unaccompanied by any of his "sons," בָּנָיו (*banêha*), mentioned in Job xxxviii. 32, but the Great Bear (Ursa Major). (עָיִשׁ) *Ash* is formed by aphæresis from עָשְׁיָה (*neash*) = a bier or litter. In Arabic *naasch*, cognate with the Heb. עָשְׁיָה (*neash*), is the name of the four stars (α, β, γ, and δ) constituting the hinder portion of the Great



URSA MAJOR AND THE STAR ARCTURUS.

Bear; whilst the three in the tail (ε, ζ, η) are called in Arabic *Banatnaasch* = daughters of the bier, meaning, the mourners following the bier. The last of these (η) is still designated by its Arabic name *Benetnasch* (q.v.).

areolar tissue.

1. *Anat.:* A tissue widely diffused through the body, and composed of white and yellow fibres, the former imparting to it strength, and the latter elasticity. The two kinds of fibres interlace with each other again and again in the most complex manner. The interstices left between them are of very unequal size, and should not be called, as for a long time they were, cells. Areolar tissue protects from injury the parts of the body in which it occurs, and when placed in the interstices of other tissues it keeps the latter from moving as freely as otherwise they would. The *cutis vera*, or true skin, is composed of it, and it abounds in the exterior parts of the muscles and in the interstices between their fibres, beneath the skin, on the surface of the pharynx, and the œsophagus. (*Todd & Bowman: Physiol. Anat.*)

"This adipose tissue is generally found associated with the *areolar* or connective tissue."—*Beale: Bioplasm* (1872), § 182.

2. *Bot.:* A term occasionally applied to cellular tissue.

ăr-ē-ŏm'-ĕ-tĕr, *s.* [In Ger. *areometer*; Fr. *aréomètre*; Port. *areometro*; from Gr. ἀραιός (*araios*) = (1) thin, (2) porous, and μέτρον (*metron*) = a measure.] An instrument designed to measure the specific gravity of liquids. The simpler areometers measure only the *relative* weights of liquids. They consist of a tube of glass, terminated in a ball at its lower part, and divided into equal portions through its whole length. Another ball filled with mercury is soldered below to keep it vertical. The depth to which it sinks in various liquids is in the inverse ratio of their relative specific gravities. In Fahrenheit's areometer there is an adjustment by weights, so that the volume of the part immersed is constant, and thus the *absolute* specific gravity of the liquid tested is ascertained, that of water being previously fixed. (*Glossog. Nov., &c.*)

Chem.: Argentic salts are distinguished by giving with hydrochloric acid a white precipitate of argentic chloride (AgCl), which is insoluble in boiling water and in nitric acid, but dissolved by ammonia without blackening. Argentic sulphide (Ag_2S) is black; argentic phosphate (Ag_3PO_4) is yellow; argentic chromate ($Ag_2C_2O_4$) is brick-red; Ag_2CO_3 is white, insoluble in water, soluble in nitric acid or in ammonia. Caustic alkalies give a brown precipitate of Ag_2O, which is soluble in ammonia. Argentic iodide (AgI) is a pale yellow colour, insoluble in ammonia or in nitric acid.

Argentic Chloride (AgCl) is obtained as a curdy-white precipitate by adding a soluble chloride to argentic nitrate. It is insoluble in water and in acids, but dissolves in ammonia, in potassic cyanide, and is slightly dissolved by a saturated solution of sodium chloride. When melted it looks like horn, hence it has been called *horn silver.* It is acted upon by light. The chloride, iodide, and bromide are used in photography.

Argentic nitrate ($AgNO_3$) is obtained by dissolving silver in nitric acid. It crystallises in transparent anhydrous colourless tables, soluble in their own weight of cold water, and in half their weight of boiling water; it is also soluble in alcohol. When fused it is called *lunar caustic,* and is used for marking ink and to dye hair. It is used in medicine as a caustic for wounds, and is administered internally in small doses as an astringent and alterative to the mucous coats of the stomach. It also acts as a tonic; but it stains the skin a blue leaden colour when it has been taken for a long time. It has been given for epilepsy.

Argentic oxide (Ag_2O) is a brown powder, which is obtained by adding caustic potash to argentic nitrate. It is a powerful base, decomposed at red heat into silver and oxygen.

Argentine Confederation or **Argentine Republic:** A South American Republic—that of La Plata—lying along and south from the great La Plata river. Its capital is Buenos Ayres. Though there are silver mines within this vast region, yet it is not after them that the territory is named. Argentine, from Sp. *argento*=silver, is simply a synonym for *plata* = silver, in the term *Rio de la Plata* = river of silver. Under the reflection of the sun's rays, every river presents a silvery aspect, the Rio de la Plata in this respect not surpassing a multitude of others.

ar'-ǧen-tīte, *s.* [Lat. *argentum* = silver, and Eng. suffix *-ite.*] A mineral placed by Dana at the head of his Galena group of minerals. It occurs in isometric crystals; also reticulated, arborescent, and filiform. The hardness is 2—2·5; sp. gr., 7·196—7·365; lustre, metallic. It is opaque, has a sub-conchoidal fracture, and is perfectly sectile. It consists of about 12·9 parts of sulphur, and 87·1 of silver. It is found in Cornwall, also in Germany, Norway, Hungary, the Ural Mountains, and America. It is closely akin to Argentopyrite and Salpaite (q.v.).

and translucent. Aristotle supposed that it floated with the concave side up, the animal holding out its arms, after the manner of sails, to catch the breeze. Poets have ever since repeated the fable; but naturalists know that when the Argonaut floats the sail-shaped arms are applied closely to the sides of the shell, and when the animal crawls at the bottom the so-called boat is reversed like the shell of a snail. In 1875, Tate estimated the known species at four recent and two fossil, the latter being from the tertiary rocks.

"*Argumentation* is that operation of the mind whereby we infer one proposition from two or more propositions premised; or it is the drawing a conclusion, which before was unknown or doubtful, from some propositions more known and evident: so when we have judged that matter cannot think, and that the mind of man doth think; we conclude that therefore the mind of man is not matter."—*Watts: Logick.*

Argumentum ad baculum. (*Humorously.*) An appeal to the stick, as when a schoolmaster renders an argument which has produced only limited conviction among his pupils conclusive, at least to the extent of silencing gainsayers, by the use of the birch. The phrase may be employed also in a vaguer sense for any appeal to physical force; as when a French political party "descends into the streets."

argumentum ad hominem. [*Lit.* = argument to a, or to the, man.] An argument drawn from an appeal to the man himself; that is, founded on his professed principles, his conduct, or the concessions he has made. St. Paul's argument, in Rom. ii. 17, &c., is an *argumentum ad hominem.*

argumentum ad ignorantiam. [*Lit.* = an argument to ignorance.] An argument in which a too confident disputant is reminded of his ignorance. When John Foster, reasoning against atheism, reminds the man who categorically and dogmatically declares that there is no God, that his personal experience has been limited to what has occurred in one fragment of the earth, and one very brief period of time, and that possibly, had he traversed the universe and lived through a bygone eternity, he somewhere or at some time might have found proofs of the Divine existence which would have convinced even him, the argument is one *ad ignorantiam.*

argumentum ad verecundiam. [*Lit.* = an argument to modesty.] An appeal to a person's modesty; as if one were to say to an opponent, "Well, Sir Isaac Newton was of a different opinion; but perhaps you are more competent to judge than he was."

The male measures between five and six feet from the tip of the bill to the extremity of the tail, and is an eminently beautiful bird, the quill-feathers of the wings, which often exceed three feet in length, being ornamented all along by a series of ocellated spots. The Argus Pheasant inhabits the larger islands of the Eastern Archipelago.

¶ The name *Shetland Argus* is given to a starfish (*Astrophyton scutatum*). It is called also the Basket Urchin or Sea-basket. The arms branch again and again dichotomously, so that their ultimate fibres are supposed to be about 80,000 in number.

argus-eyed, *a.* Very observant; allowing little that is cognizable by a momentary glance of the eye to escape one's notice.

argus-shell, *s.* A species of porcelain-shell, beautifully variegated with spots somewhat resembling those upon a peacock's tail.

B. *As substantive:* A follower of Arius, presbyter of Alexandria in the fourth century A.D., or one holding the system of doctrine associated with his name. During the first three centuries of the Christian era what was subsequently called the doctrine of the Trinity had become the subject of controversy, chiefly in one direction; it had been decided against Sabellius that there are in the Godhead three distinct persons, whereas Sabellius had in effect reduced the three to one. [SABELLIANISM.] In the year 317, Alexander, Bishop of Alexandria, having publicly expressed his opinion that the Son of God is not only of the same dignity as the Father, but of the same *essence* [in Gr. οὐσία (*ousia*)], Arius, one of the presbyters, considered this view as leaning too much to Sabellianism, and, rushing to the other extreme, he declared that the Son of God was only the first and noblest of created beings, and though the universe had been brought into existence through His instrumentality by the Eternal Father, yet to that Eternal Father He was inferior, not merely in dignity, but in *essence*. The views of Arius commended themselves to multitudes, while they were abhorrent to still more; fierce controversy respecting them broke out, and the whole Christian world was soon compelled to take sides in the struggle. Constantine, the first Christian emperor, was then the reigning sovereign, and after he had failed by private means to restore peace and unity, he summoned a council to meet at Nice, in Bithynia, which it did in A.D. 325. It was the first general council and the most celebrated of all. It declared Christ to be ὁμοούσιος (*homoousios*), *i.e.*, of the *same* essence as the Father, whereas Arius regarded Him as only ὁμοιούσιος (*homoiousios*), of *similar* essence. The erring presbyter was deposed and exiled; but his numerous followers maintained his doctrine, and were at times so successful that each party had in turn the power, of which it had no scruple to avail itself, of using carnal as well as spiritual weapons against its adversaries; indeed, it is believed that Arius himself died by poison. It would occupy too much space to detail the vicissitudes of a highly-chequered struggle; suffice it to say that the Arians greatly weakened themselves by splitting into sects [SEMI-ARIAN], and the doctrines regarding the relation of the three Divine Personages authoritatively proclaimed at Nice were at last all but universally adopted. They may be found detailed in what are popularly termed the Nicene and the Athanasian Creeds. [NICENE, ATHANASIAN.] They were held almost without a dissentient voice through the Middle Ages, and were cordially accepted by the leading reformers. The Churches of Rome, England, and Scotland are all at one with regard to the doctrine of the Trinity, as are also the most powerful bodies of English Nonconformists. Arianism has from time to time appeared in the churches, but as a rule its adherents have sooner or later gone back to orthodoxy or forward to Unitarianism; and of 164 English religious sects enumerated by the Registrar-General as possessing certified places of worship in England during the year 1878 there was not one officially designated as Arian.

I. *Astronomy:*

1. The constellation Aries, or the Ram, one of the ancient zodiacal constellations, and generally called the first sign of the zodiac.

2. The portion of the ecliptic between 0° and 30° long., which the sun enters on the 21st of March (the vernal equinox). The constellation Aries, from which the region derives its name, was once within its limits, but now, by the precession of the equinoxes, it has gradually moved into the space anciently assigned to Taurus. [PRECESSION.] It is denoted by the symbol ♈, which remotely resembles a ram's head. (*Herschel: Astron.*, §§ 380, 381.)

"At last from *Aries* rolls the bounteous sun,
And the bright Bull receives him."
Thomson: Seasons; Spring.

The first point of Aries is the spot in the heavens where the sun appears to stand at the vernal equinox. It is not marked by the presence of any star, but it is not very far from the third star of Pegasus, that called Algenib. It is the point from which the right ascension of the heavenly bodies are reckoned upon the equator and their longitudes upon the ecliptic. [RIGHT ASCENSION.] (*Airy: Popul. Astron., &c.*)

"As to the other forms of government, Socrates would say, That when the chief offices of the commonwealth were lodged in the hands of a small number of the most eminent citizens, it was called an *aristocracy*."—*Xenophon: Memorab. of Socrates.* (*Richardson.*)

"The word *aristocracy*, which is now made to mean men of the upper ranks, even lower than those of the nobility, means, by right, not [illegible] but only a state-wielding by the nobles; and in England there is no *aristocracy* but that of the House of Lords."—*Barnes: Early England and the Saxon English* (1869), pp. 110, 111.

2. The nobles and other people of position and wealth in a country, taken collectively; or in a more extended sense, those who rise above the rest of the community in any important respect. 2. One who considers the best form of government to be that which places the chief power in the hands of the aristocracy of birth and rank.

3. One who really is, or at least is considered to be, despotic in temper.

"What his friends call *aristocrats* and despots."—*Burke.*

ăr-ĭs-tō-lō'-chĭ-ą (*Mod. Lat.*), † **ăr-ĭs-tō-lō'-chȳ** (*Eng.*), *s.* [In Fr. *aristoloche*, Sp. [illegible], Port. [illegible], Ital. [illegible], Gr. ἀριστολοχία (*aristolochia*) = an herb [illegible] which ἄριστος (*aristos*) = best, and λοχεία (*lochia* = childbirth.)

A. *As botanical term:* (*Of the form* **aristolochy**.) Birthwort, any plant of the genus Aristolochia. See B.

"[illegible] *aristolochy* [illegible] *birthwort*."—*Fernandez Spanish Ind.* [illegible] 1800.

B. *Bot.* (*Of the form* aristolochia.) A genus of plants, the typical one of the order Aristolochiaceæ, or Birthworts. They have curiously inflated irregular flowers, in some cases of large size; these consist of a tubular coloured calyx, no corolla, six stamens, one style, and a six-celled capsular fruit, with many seeds. One species, the *A. clematis*, or Common Birthwort, a plant with pale-yellow tubular flowers, swollen at the base, is naturalised among old ruins in the east and south of England. Most of the Aristolochias are emmenagogue, especially the European species, *A. rotunda, longa,* and *clematitis*, and the Indian *A. Indica;* the last-named species is also antarthritic. *A. bracteata* is anthelmintic; when bruised and mixed with castor-oil it is used in cases of obstinate psora. *A. odoratissima*, of the West Indies, is alexipharmic. The *A. fragrantissima* of Peru is given in dysenteries, fevers, rheumatism, &c.; *A. serpentaria* (the Virginian Snake-root), besides being given in the worst forms of typhus fever, is deemed of use against snake-bite; as is also *A. trilobata.* (*Lindley.*) The *Treasury of Botany* points out that faith in the efficacy of some Aristolochia or other, as an antidote to the poison of serpents, prevails in America, Egypt, and India, its existence in regions so remote from each other affording strong evidence of its truth.

ăr-ĭs-tŏ-lō-chĭ-ā'-çē-æ, *s. pl.* [ARISTOLOCHIA.]

Bot.: An order of plants placed by Lindley under his last or Asaral alliance of Perigynous Exogens. It has hermaphrodite flowers, six to ten epigynous stamina, a three or six-celled inferior ovary, and wood without concentric zones. In 1846, Lindley estimated the known species at 130. Many are climbing plants. In their qualities they are tonic and stimulating. [ARISTOLOCHIA, ASARUM.]

His natal place being Stagira, now Stauros, a town of Macedonia, he is often called "the Stagyrite." He was a disciple of Plato, tutor of Alexander the Great, a highly distinguished teacher at Athens, the author of treatises on nearly every subject of human thought, and the founder of the Peripatetic Philosophy, his writings on the last-named theme and on Logic being venerated during the Middle Ages as no other book was but the Bible.

ăr'-ĭth-măn-çy, *s.* [Gr. ἀριθμός (*arithmos*) = a number, and μαντεία (*manteia*) = prophesying, divination; μάντις (*mantis*) = a diviner, a prophet.] Pretended divination of future events by means of numbers.

ą-rĭth'-mĕt ĭc, * **ą-rĭth'-mĕt-ĭck,** * **ą-rĭth mĕt-ĭcke,** **ars mĕt-rike,** **ars' mĕt-rỹk,** *s.* [In Gr. *arithmetikē*; Fr. *arithmétique*; Port. *aritmetica*; Sp. & Ital. *aritmetica*; Lat. *arithmetica*, Gr. ἀριθμητικὴ (*arithmētikē*) [supply τεχνη (*techne*) = art], the fem. of ἀριθμητικος (*arithmētikos*) = of or for numbering; ἀριθμός (*arithmos*) = number.] In its broadest sense the science and art which treat of the properties of numbers. This definition, however, would include Algebra, which is considered a distinct branch. Algebra deals with certain letters of the alphabet, such as *x, y, z, a, b, c,* &c., standing as symbols for numbers; arithmetic operates on numbers themselves, as 1, 2, 3, 4, &c. Viewed as a science, arithmetic is a branch of mathematics; looked on as an art, its object is to carry out for practical purposes certain rules regarding numbers, without troubling itself to investigate the foundation on which those rules are based.

It is variously divided, as into *Integral* and *Fractional Arithmetic*, the former treating of integers, and the latter of fractions. Integral arithmetic is sometimes called *Vulgar* or *Common Arithmetic;* and from fractional arithmetic is sometimes separated *Decimal Arithmetic*, treating, as the name implies, of decimals. There are also *Logarithmic Arithmetic* for computation by logarithms, and *Instrumental Arithmetic* for calculation by means of instruments or machines. Another division is into *Theoretical Arithmetic*, treating of the science of numbers, and *Practical Arithmetic*, which points out the best method of practically working questions or sums. *Political Arithmetic* is arithmetic applied to political economy, as is done in the statistical returns so continually presented to Parliament. Finally, *Universal Arithmetic* is a name sometimes applied to Algebra. The chief subjects generally treated under the science or art of Arithmetic are (1) Numeration and Notation; (2) Addition; (3) Subtraction; (4) Multiplication; (5) Division; (6) Reduction; (7) Compound Addition; (8) Compound Subtraction; (9) Compound Multiplication; (10) Compound Division; (11) Simple Proportion (Rule of Three); (12) Compound Proportion; (13) Vulgar Fractions; (14) Decimal Fractions; (15) Duodecimals; (16) Involution; (17) Evolution; (18) Ratios, Proportions, and Progressions; (19) Fellowship or Partnership; (20) Simple Interest; (21) Compound Interest; and (22) Position. (*Hutton, &c.*) Of these, the most important are the simple processes of Addition, Subtraction, Multiplication, and Division, the judicious use of which, singly or in combination, will solve the most complex arithmetical questions.

"At the same time one of the founders of the Society, Sir William Petty, created the science of political *arithmetic*, the humble but indispensable handmaid of political philosophy."—*Macaulay: Hist. Eng.*, ch. iii.

Arithmetic of Infinites: The summing up of an infinite series of numbers.

ăr-ĭth-mĕt'-ĭc-ąl, *a.* [Eng. *arithmetic; -al.*] Pertaining to arithmetic.

"... should his comprehension of *arithmetical* principles be unquestionable."—*Herbert Spencer: Psychol.*, 2nd ed., vol. ii., § 388, p. 812.

arithmetical complement. That which a number wants to make it reach the next highest decimal denomination. Thus the arithmetical complement of 4 is 6, for 4 + 6 are = 10, and that of 642 is 358, because 642 + 358 are = 1,000. The *arithmetical complement of a logarithm* is what it wants to make it reach 10.

arithmetical mean.

1. The number, whether it be an integer or a fraction, which is exactly intermediate between two others. Thus, 5 is the arithmetical mean between 2 and 8; for 2 + 3 are = 5, and 5 + 3 are = 8. To find such a mean, add the two numbers together, and divide their sum by 2; thus 2 + 8 = 10, and 10 ÷ 2 = 5.

2. *More loosely:* Any one of several numbers in an arithmetical ratio (q.v.) interposed between two other numbers. Thus, if 6, 9, and 12 be interposed between 3 and 15, any one of them may be called an arithmetical mean between these two numbers.

arithmetical progression. A series of numbers increasing or diminishing uniformly by the same number. If they increase, the arithmetical progression is said to be ascending, and if they decrease, descending. Thus the series 3, 6, 9, 12, 15 is an ascending arithmetical progression increasing by the continued addition of 3; and the series 8, 6, 4, 2, is a descending one, falling regularly by 2. [PROGRESSION.]

arithmetical proportion. The relation existing between four numbers, of which the first is as much greater or less than the second, as the third is than the fourth; the equality of two differences or arithmetical ratios. In such cases the sum of the extremes is = that of the means. [PROPORTION.]

arithmetical proportionals. The numbers so related to each other. (The term is opposed to geometric proportionals.) [PROPORTIONAL.]

arithmetical relation. The comparison of numbers in an arithmetical progression with the view of ascertaining how much they differ from each other.

arithmetical ratio. The difference between any two numbers constituting part of a series in arithmetical progression.

ăr-ĭth-mŏm'-ĕ-tẽr, *s.* [From Gr. ἀριθμός (*arithmos*) = a number, and μέτρον (*metron*) = a measure.] A machine which enables a person, however unskilled, to perform the operations of multiplication and division with facility, rapidity, and unfailing accuracy. The arithmometer of M. Thomas (De Colmar), highly commended by General Hannyngton (*Journal of Actuaries*, vol. xvi., p. 244) and by Mr. Peter Gray, F.R.A.S., and others, does more, for, in forming the product of two given numbers, it can either add that product to, or subtract it from, another given number, according to the pleasure of the operator. The machine is provided on its face with spaces for the reception of three numbers, say P, Q, and R. These being properly placed, the turning of a handle brings out the value of P + Q R or P − Q R, according as the regulator was adjusted for addition or subtraction.

that they are in armour, is applied to these animals because the upper part of their body is covered with large strong scales or plates, forming a helmet for their head, a buckler for their shoulders, transverse bands for their

back, and in some species a series of rings for the protection of their tail. Another peculiarity is the great number of their molar teeth; these amount in one species to more than ninety. There are five toes on the hinder feet, and four or five, according to the species, on the anterior ones. The fore feet are admirably adapted for digging, and the animal, when it sees danger, can extemporise a hole and vanish into it with wonderful rapidity. If actually captured, it rolls itself into a ball, withdrawing its head and feet under its strong armour. There are several species—such as the Great Armadillo, or Tatu (*Dasypus gigas*), the Three-banded Armadillo, or Apara (*D. Apar*), the Six-banded Armadillo (*D. sexcinctus*), and the Hairy Armadillo (*D. villosus*). 2. A genus of Crustaceans belonging to the order Isopoda, and the family Oniscidæ, the type of which is the well-known wood-louse. Mech. & Astron.: A sphere not solid like a modern celestial globe, but consisting of several metallic or other circles mechanically fixed in such relative positions that one represented the celestial equator, a second the ecliptic, and two more the colures. It was capable of revolving on its axis within a movable horizon. Astronomers used the armillary sphere for purposes of instruction not merely in ancient times, but on to the age of Tycho Brahe, in the sixteenth century. Now, however, it has fallen into disuse, having been superseded by the celestial globe. [ASTROLABE, CELESTIAL.]

"When the circles of the mundane sphere are supposed to be described on the convex surface of a sphere, which is hollow within, and, after this, you imagine all parts of the sphere's surface to be cut away, except those parts on which such circles are described; then that sphere is called an *armillary sphere*, because it appears in the form of several circular rings, or bracelets, put together in a due position."—*Harris: Description of the Globes.*

B. *As substantive:*

Church Hist.: A follower of Arminius, or in other words, of James Harmensen (see etym.), first a Dutch minister in Amsterdam, and afterwards Professor of Theology in Leyden University. The views of himself and his followers were summed up in five points, which may be briefly stated thus:—1. That God from all eternity predestinated to eternal life those who He foresaw would have permanent faith in Christ. 2. That Christ died for all mankind, and not simply for the elect. 3. That man requires regeneration by the Holy Spirit. 4. That man may resist Divine grace. 5. That man may fall from Divine grace. This last tenet was at first held but doubtfully; ultimately, however, it was firmly accepted. Arminius died in the year 1609. In 1618 and 1619 the Synod of Dort condemned the Arminian doctrines, the civil power, as was the general practice of the age, enforcing the decrees of the council by pains and penalties. [REMONSTRANTS.] Nevertheless the new views spread rapidly. Archbishop Laud introduced them into the Church of England; the Wesleyans also are essentially Arminians; whilst the remainder of the English Nonconformists and the Presbyterians in Scotland and elsewhere are mostly Calvinists. The only English sect formally called after Arminius is that of the "Arminian New Society."

Ar-mĭn'-ĭ-ąn-ĭzm, *s.* [Eng. *Arminian*; *-ism.* In Ger. *Arminianism.*] The distinctive religious tenets held by the Arminians.

arm'-lĕt, *s.* [Eng. *arm*; suffix *-let*, used as a diminutive.]

1. A small arm.

2. A bracelet worn on the upper arm as contradistinguished from one of the ordinary type encircling the wrist. Armlets are of two kinds.

ARMLETS.

(*a*) Those worn by men in the East as one of the insignia of royal power. Kitto thinks that the אֶצְעָדָה (*etsadah*), or so-called "bracelet," which the Amalekite said he took from the arm of the slain Saul, was an armlet of this symbolic character (2 Sam. i. 10). The same Hebrew word, again rendered "bracelet," occurs in Numb. xxxi. 50, and probably with the same meaning. Armlets of this nature are still seen on Persian, Hindoo, and other sovereigns, and in most cases they are studded with expensive jewels.

"*Armlet.* Although the word has the same meaning as *bracelet*, yet the latter is practically so exclusively used to denote the ornament of the wrist, that it seems proper to distinguish by *armlet* the similar ornament which is worn on the upper arm. There is also this difference between them, that in the East bracelets are generally worn by women, and armlets only by men. The *armlet*, however, is in use among men only as one of the insignia of sovereign power."—*Kitto: Bib. Cyel., Art.* "*Armlet*"

(*b*) Those worn by women in our own and other countries simply for ornament.

"Every nymph of the flood her tresses rending,
Throws off her *armlet* of pearl in the main."
Dryden: Albion & Albianus, iii.

† **ar-mō'-nĭ-a,** *s.* [HARMONIA.]

"... the thridde kynde is Sal *armoniac*, ..."—*Chaucer: C. T.*, 13,751-2.

ar-mŏn'-ĭ-cal. [HARMONICAL.]

ar'-mŏn-y, *s.* [HARMONY.] (*Scotch.*)

ar'-mŏr, †ar'-moŭr, *ar-moure, *ar-mure, *s.* [In Fr. *armure*; O. Fr. *armeure*; Sp. & Port. *armadura*; Ital. & Lat. *armatura* = equipment, outfit, armor; *armo* = to fit out with implements, to equip; *arma* = implements, arms.]

A. *Ordinary Language:*

1. *Lit.:* Defensive arms; a covering designed to protect the body, especially in war, from being injured by any weapon the foe could use. In the authorised version of the Bible it is frequently mentioned under its appropriate name (1 Sam. xvii. 54; 1 Kings xxii. 38, &c.), and several times under the name *harness*, which was a term for armor common during the fifteenth and sixteenth centuries (1 Kings xx. 11; xxii. 34; 2 Chron. ix. 24). [HARNESS.] The heroes of the Trojan war are described by Homer as wearing it. It was in use among the other nations of antiquity, but it was not till the age of chivalry that it reached its full development. From the list of pieces of armor enumerated in the subjoined example, quoted by Nares from Warner, it can be well understood that a knight "in compleat armour" was too well protected to be in much danger from a foe, and too unwieldy to put that foe in much danger. *Mail armor* was in use from 1066 to 1300. It was *tegulated*, consisting of little imbricated plates sewn upon a hauberk without sleeves or hood; *ringed* or *chain*, consisting of interlocking rings; *gamboised*, consisting of padded work stitched; *scaled*, of small circular plates like fish scales. *Mixed armor* to 1410, chain and plate. *Plate armor* to 1600, composed of large plates, and entirely enclosing the body. *Half armor* to eighteenth century, consisting of helmet and body armor only. Armor has almost disappeared in modern warfare, its only remnant being the defence against sword blows worn by cavalry. Recently, however, a bullet-proof coat has been devised, which may be worn by future infantry.

"To them in compleat *armour* seem'd the greene knight to appeare.
The burgonet, the bever, buffe, the coller, curates, and
The poldrons, grangard, vambraces, gauntlets for either hand,
The taishes, cushies, and the greves, staff, pensell, baises, all
The greene knight earst had tylted with, that held her love his thrall."
Warner: Alb. Engl., bk. xii., p. 291. (*Nares.*)

2. *Fig.:* Anything designed and fitted to prove a defence against spiritual enemies.

¶ The "*armour of light*" (Rom. xiii. 12), opposed to "the works of darkness," would seem to be holy deeds. "*The armour of righteousness*" (2 Cor. vi. 7), as the name implies, is righteousness, justice. The "*armour of God*" (Eph. vi. 11, 13), is described at length in verses 13 to 20.

B. *Technically:*

1. *Law. The Statutes of armor*, repealed in the reign of King James I., were ancient enactments requiring every one, according to his rank and estate, to provide a determinate quantity of the weapons then in use, that if required he might aid in the defence of his country against domestic commotion or foreign invasion. (*Blackstone's Comment.*, bk. i., chap. 13.) Embezzling or destroying the king's armor or warlike stores was, by 31 Eliz., 3, 4, felony. (*Ibid.*, iv. 101, 102.)

ar-mŏr-ā'-cĭ-a, *s.* [Lat. *armoracia, armoracea, armoracium*; Gr. ἀμωράκιον (*armorakion*) = horse-radish; from *Armorica*, the Latin name of Brittany, where it was said to grow abundantly.] Horse-radish or Water-radish. A genus of plants belonging to the order Brassicaceæ, or Cruciferæ. It contains one species, the *A. camphobia*, or Great Water-radish, wild in Britain; and another, the *A. rusticana*, or Common Horse-radish, naturalised. The former has yellow flowers, and the latter white.

Now it is divided into several French departments.

B. *As substantive:* The language of Armorica. It is called by the French Bas Breton. It belongs to the Celtic family, and is akin to the Welsh and the extinct Cornish. (In the etymologies of this Dictionary it is cited as *Arm.*)

¶ War is so exciting, that when it breaks out it powerfully attracts the attention of the general public in every country; hence a number of phrases, at first purely military, now occur in ordinary English authors. [For these see B. 1.]

2. War, a state of hostility; the act of taking arms. [B.]

B. *Technically:*

I. *Mil.:* In the same sense as A. 1. Military arms are of two kinds: *arms of offence*, or *offensive arms*, and *arms of defence*, or *defensive arms*. Under the first category are rifles, pistols, muskets, cannons, swords, bayonets, &c.; and under the latter, shields, helmets, cuirasses, greaves, or any similar defence, for the person. Of offensive weapons, those in which flame is generated are called *fire-arms*.

II. *Law:* Anything which one takes in his hand in anger to strike another with or throw at him. Pistols and swords are, of course, arms in the legal sense, but so also are stones and sticks.

III. *Heraldry. Armorial bearings:* In the days when knights were so encased in armour that no means of identifying them was left, the practice was introduced of painting their

insignia of honour on their shield, as an easy method of distinguishing them. For a time these were granted only to individuals, but Richard I., during his crusade to Palestine, made them hereditary. The reason why they are called *coats of arms* is that they used to be introduced on the surcoat of their possessor, but the term once introduced was afterwards retained even when they were displayed elsewhere than on the coat. These are usually divided into (1) *public*, as those of kingdoms, provinces, bishoprics, corporate bodies, &c.; and (2) *private*, being those of private families. These again are separated into many subdivisions, founded mainly on the varied methods by which arms can be acquired. [Assumption, Canting, Dominion, Feudal, &c.]

The College of Arms, or *Heralds' College*, is situated in Queen Victoria Street, London. It has at present one Earl Marshal, three kings of arms, called respectively Garter, Clarencieux, and Norroy; six heralds, and four pursuivants, with a Secretary to the Earl Marshal and a Registrar.

1. *Lit.* (*Ord. Lang. & Milit.*): A body of men, enlisted, brought together, drilled and armed for warfare. The three chief arms of the service are Infantry, Cavalry, and Artillery; all other branches, such as Engineers, the Commissariat, Transport, Police, Postal, Medical, and Chaplains' departments, being auxiliary. The officers of the British army consist of field-marshals, generals, lieutenant-generals, major-generals, colonels, lieutenant-colonels, majors, captains, and lieutenants. An army is composed of army corps consisting of divisions, these of brigades, and these of battalions. Each has a separate staff, but the division is the first unit that has a proportion of each of the three arms and of the several departments. It is arranged for battle in two or more lines, the infantry occupying the centre, the cavalry one or both flanks, the artillery, as far as possible, conveniently massed. Cavalry is organized in regiments, one attached to each division, the remainder as the cavalry brigade, which, with a battery of horse artillery, is attached to a corps. Artillery is organized in batteries of six guns each. Milton represents Satan, leading the infernal hosts, as bringing up his troops in "a hollow cube" (a solid square), having

> "His devilish enginery impaled
> On every side with shadowing squadrons deep."

When all is ready, then, according to the poet,

> "to right and left the front
> Divided, and to either flank retired."

The way thus cleared, the guns are suddenly displayed and fired. (*Milton's P. L.*, bk. vi.)

(*e*) An *army of reserve* is one not itself at the moment engaged in fighting, but all ready to furnish men to another army which is so, or, if need arise, to go *en masse* to its assistance. (*Ibid.*)

(*f*) A *standing army* is an army so embodied that it continues from year to year without requiring for its perpetuation an annual legislative vote. The British army is not a standing one, the Legislature during each successive year authorising its continued existence, and fixing the number of men of which for the time being it is to consist. So jealous were the people of a standing army, that after the peace of Ryswick, concluded in 1697, the majority of the nation wished to disband all the highly-trained and experienced soldiers of England, and trust the defence of the country to the militia alone. King William and his minister Somers could with difficulty obtain permission to keep 10,000 professional soldiers; and to make sure that they did not illegally enlist more, the expenses of the army were fixed as low as £350,000. The standing army of the United States is limited by the law of 1874 to 25,000 men, this being considered an amply sufficient force in times of peace.

Arnica montana: root and flowers.

German Leopard's-bane. It is not a British species, but is common in the alpine parts of Germany, Sweden, Lapland, and Switzerland. It is a perennial, of a slightly fetid odour, and a bitterish acrid taste. Given in large quantities it produces deleterious effects, but the powdered leaves, in moderate doses of five to ten grains, have been found serviceable in paralysis, convulsions, amaurosis, chlorosis, gout, and rheumatism. (*Castle: Lexic. Pharmaceut.*, 2nd ed.) As an outward application, arnica is in constant use as a remedy for sores, wounds, bruises, and ailments of a similar kind. It is also employed as an internal medicine.

Ar'-nôld-ĭst, *s.* [From the *Arnold* mentioned below.]

Ch. Hist.: A follower of Arnold of Brescia, who, in the twelfth century, when the papal power was at its maximum, opposed the Pope's temporal authority, and proposed that the Church should be disendowed and left for its support to the freewill offerings of the people. For advocating these views he was strangled to death at Rome in the year 1155, and to prevent the people paying veneration to his remains his corpse was burnt and the ashes thrown into the Tiber. All the more on account of his cruel fate, his name was enshrined in the affections of many, and the Arnoldists from time to time gave trouble to the Papacy. (*Mosheim: Ch. Hist.*, Cent. xii., pt. ii., chap. 5, § 10.)

ar-nŏt'-tŏ, ar-năt'-tŏ, ăn-nŏt'-tŏ, ăn-nŏt'-tą, ą-năt'-tŏ, *s.* [Etym. doubtful, perhaps the native American name.]

1. *Comm.:* The waxy-looking pulp which envelopes the seeds in the arnotto-tree. This is detached by throwing the seed into water, after which it is dried partially, and made up first into soft pellets, rolled in leaves, in which state it is called *flag* or *roll arnotto*. Afterwards, becoming quite dry, it is formed into cakes, and becomes *cake arnotto*. The South American Indians colour their bodies red with it; farmers here and elsewhere use it to stain cheese; in Holland the Dutch employ it to colour butter; the Spaniards put it in their chocolate and soups; dyers use it to produce a reddish colour, and varnish makers, to impart an orange tint to some varnishes. As a medicine it is slightly purgative and stomachic.

¶ This substance is very frequently adulterated. Previous to the passing of the Adulteration Act it was found almost impossible to obtain a pure sample, the adulterants being flour, rye meal, turmeric, chalk, gypsum, Venetian red, and, in some cases, red lead; this last substance being a poison. At the present time the only adulterants used are flour, turmeric, and small quantities of either chalk or gypsum. Pure arnatto should not contain more than six per cent. of ash. Adulterated samples contain as much as twenty or even thirty per cent. The organic adulterants are easily detected by the microscope.

> "*Arnotto* dyeth of itself an orange-colour, is used with pot-ashes upon silk, linen, and cottons, but not upon cloth, as being not apt to penetrate into a thick substance."—*Sir W. Petty, in Sprat's Hist. of the Royal Society*, p. 229.

It is from twenty to thirty feet in height, and grows in tropical America. [Bixa.] It is the type of the old order Bixaceæ, now more generally called Flacourtiaceæ (q.v.).

In India, where the word is continually used by Anglo-Indians and others, arrack is made by double distillation chiefly from "todi" or "toddy," a sweet juice derived from the unexpanded flowers of various palm-trees, and notably of the coco-nut (*Cocos nucifera*). [COCOS, TODDY.] It is manufactured also from the succulent flowers of the Bassia genus of trees [BASSIA], from rice, and from other vegetable products. Liberty to sell it in the several districts of India is farmed out to native contractors at a stipulated sum, notwithstanding which it is obtainable at a very cheap rate, which leads to a good deal of drunkenness both among European soldiers in the East and the low caste natives of India. ¶ See also examples given under ARREST, *s.*

B. *Technically:*

I. *Law:*

1. *Of persons:* The seizure of a suspected criminal or delinquent that security may be taken for his appearance at the proper time before a court to answer to a charge. Ordinarily a person can be arrested only by a warrant from a justice of the peace; but there are exceptional cases in which he can be apprehended by an officer without a warrant, by a private person also without a warrant, or by what is technically called a *hue and cry*. An arrest is made by touching the body of the person accused, and after this is done a bailiff may break open the house in which he is to take him; but without so touching him first it is illegal to do so. The object of arrest being to make sure that he answers to a charge about to be brought against him, it does not follow that after being seized he is incarcerated; if bail for his appearance at the proper time be given, and the case be not too aggravated a one for such security to be accepted, he will be released till the day of trial. The privilege of exemption from arrest is granted to peers of the realm, members of Parliament, and corporations, clerks, attorneys, and others attending the courts of justice, clergymen whilst actually engaged in performing divine service, and some other classes. No arrest can take place on Sunday, except for treason, felony, or breach of the peace.

¶ *In the United States* the law of arrest differs in certain respects from that in England, though the same general principles underlie both. [ARRESTMENT.]

2. *Of things. Arrest of judgment:* The act or process of preventing a judgment or verdict from being carried out till it shall be ascertained whether it is faulty or legally correct. Judgment may be arrested (1) when the declaration made varies from the original writ, (2) where the verdict materially differs from the pleadings and issue thereon, and (3) where the case laid in the declaration is not sufficient in law to admit of an action being founded upon it. (*Blackstone: Comment.*, bk. iii., ch. 24.) Formerly the omission to state certain facts led to an arrest of judgment; but now, under the New Common Law Procedure Act, 15 and 16 Vict., c. 76, § 143, the omitted facts may, by leave of the court, be suggested.

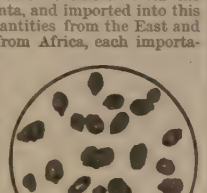
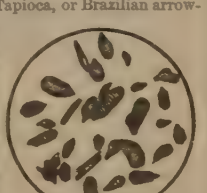
Other derivations have been given. It is, however, noteworthy that in Ger. *arrowroot* is *pfeil-wurz: pfeil* being = arrow, and *wurz* = root.]

1. *Bot.:* The English name of the botanical genus Maranta, the type of the endogenous order Marantaceæ, called by Lindley, in his *Nat. Syst. of Bot.*, the Arrow-Root tribe; but altered in his *Vegetable Kingdom* to Marants. The flowers of Maranta are in long, close, spike-like panicles, with irregular corollas, each having a single perfect stamen, with half an anther. The veins of the leaves run out obliquely from the midrib to the margin. The root is a fleshy corm, which, when washed, grated, strained through a sieve, and again repeatedly washed, furnishes the substance so much prized as food for invalids, which is described under No. 2.

2. *Comm.:* The starch extracted from the rhizomes of a Maranta, and imported into this country in large quantities from the East and West Indies, and from Africa, each importation taking the name of the place from which it comes. Thus we have East Indian arrowroot, Bermuda arrowroot, St. Vincent arrowroot, Natal arrowroot, &c. Attempts have been made to call every starch *arrowroot* which bore the slightest resemblance to the true Maranta; for example, Potato or British arrowroot, from the *Solanum tuberosum*; Tous-les-mois, or French arrowroot, from the *Canna edulis*; Tapioca, or Brazilian arrowroot, from the *Manihot utilissima*, &c. This has failed since the passing of the Adulteration Act, and it is now understood by public analysts, magistrates, &c., that arrowroot must consist entirely of the starch which is extracted from the rhizomes of a Maranta, and that any admixture of potato or other starch is regarded as an adulteration.



EAST INDIA ARROWROOT.
Magnified 100 diameters.



WEST INDIA ARROWROOT
Magnified 100 diameters.

East Indian arrowroot is said by some to be prepared from the tubers of the *Curcuma angustifolia*. Such we believe to be the case in Southern India, where it is a favourite food among the natives; but the article sold in this country as East Indian arrowroot is certainly the starch of a Marant, and not a Curcuma. This is readily determined by the microscope.

Natal arrowroot has given much trouble to the public analysts, owing to the granules somewhat resembling those of potato-starch. It has, however, been lately proved to be a genuine Maranta starch.

Portland arrowroot: A name applied to a starch prepared, some years ago, in Portland, from the roots of the *Arum maculatum*. It is not now an article of commerce.

¶ Arrowroot is adulterated either by the mixing together of various qualities of arrowroot, or by the admixture of other starches, such as potato or tapioca. Neither of these methods renders the arrowroot deleterious; but when we consider that the price of the different qualities of genuine arrowroot varies from 6d. to 2s. 6d. per pound, and that the price of potato or tapioca flour seldom exceeds 6d. per pound, we then see how the public may be cheated in pocket. The adulteration by potato or tapioca flour is readily detected by the microscope.

1. *Chem.* Arsenic is a triad semi-metallic element, but it may be a pentad in some of its compounds. Symbol, As; atomic weight, 75; vapour density, 150 (H = 1); atomic volume, ½; sp. gr., 5·75. It volatilises when heated without fusing, and its vapour smells like garlic. It is obtained by distilling native alloys of arsenic and iron, copper, cobalt, or nickel; also by heating arsenious oxide (As_2O_3) with charcoal in earthen crucibles. Arsenic has a steel-grey metallic lustre, is very brittle, and crystallises in rhombohedrons. It unites with metals when fused with them, forming brittle alloys called *arsenides.* Arsenic is added to lead used for making shot, to make it run into regular globules. Metallic arsenic is often called *black arsenic*, to distinguish it from the white arsenic of shops, which is arsenious oxide. Arsenic forms two oxides, arsenious oxide (As_2O_3) and arsenic oxide (As_2O_5), but only one chloride, $AsCl_3$ (arsenious chloride). It is prepared by distilling one part of metallic arsenic with six parts of corrosive sublimate or arsenious oxide with strong hydrochloric acid. It is a colourless, oily, poisonous liquid. Arsenic unites with nascent hydrogen, forming hydride of arsenic, AsH_3. Arsenic forms sulphides (q.v.). It also forms organic bases (see CACODYL and ARSINE). Arsenic is easily detected in cases of poisoning, but the reagents must be first tested for arsenic, as traces occur in zinc and in mineral acids. Compounds of arsenic, when heated on charcoal, give off fumes of metallic arsenic, recognised by its garlic-like smell. If heated with charcoal in a test-tube it forms a metallic ring. Arsenic is precipitated from solutions in the presence of hydrochloric acid by H_2S (see ANALYSIS), as a yellow sulphide, As_2S_3, soluble in sulphide of ammonium, also in carbonate of ammonium. A piece of bright copper heated in a solution containing arsenious oxide or an arsenite rendered acid by hydrochloric acid, becomes covered with a grey film of metallic arsenic. Any arsenic compound treated with

zinc and hydrochloric acid gives off arseniuretted hydrogen (AsH_3), which burns with a grey-blue flame, and deposits metallic arsenic on a cold porcelain dish held in the flame. It may be distinguished from antimony by dissolving in hypochlorite of sodium. Metallic arsenic, heated in a current of air, yields the characteristic octohedral crystals of arsenious acid. Nitrate of silver gives a yellow precipitate with arsenites, and a brick-red one with arseniates. Arseniates require to be reduced, or heated, before they are precipitated by sulphuretted hydrogen. Arseniates give a white crystalline precipitate with magnesium mixture and ammonia like the phosphates.

2. *Min.* Arsenic occurs native in rhombohedral crystals, or massive, reticulated, reniform, and stalactitic. The hardness is 3·5; the sp. gr., 5·93; the lustre, sub-metallic; the colour and streak, tin-white, soon tarnishing dark grey. It occurs with various metals in crystalline and schistose rocks. It is found in Norway, Hungary, Silesia, and the United States. [For other ores of it see Realgar, Orpiment, &c.]

White arsenic is the same as Arsenolite (q.v.).

arsenic-glance. *In Mineralogy*, a variety of Arsenic.

arsenic oxide. *In Mineralogy*, the same as Arsenolite (q.v.).

arsenic sulphides.

Chem.: There are three sulphides—As_2S_2, As_2S_3, and As_2S_5.

Disulphide of arsenic (As_2S_2) occurs native as realgar (q.v.). It can be prepared by melting metallic arsenic with sulphur. It is used to prepare Indian white fire, a mixture of twenty-four parts of nitre, seven parts of sulphur, and two parts of realgar. Heated with strong sulphuric acid, As_2S_2 forms arsenious and sulphurous acids. It is used as a pigment.

Arsenious sulphide (As_2S_3) occurs native as orpiment. It is obtained in a pure state by passing hydrosulphuric acid (H_2S) through a solution of an arsenite acidified by hydrochloric acid. Arsenious sulphide is used as a pigment, called King's Yellow, also as a dye stuff.

Arsenic sulphide (As_2S_5) does not exist in a separate state, but in combination with metallic sulphides, as sulpharsenates.

ar-sĕn′-ĭc, *a.* [Formed from the substantive, but distinguished from it by being accented on the second syllable instead of the first. In Fr. *arsénique;* Port. *arseniaco.*]

arsenic oxide, As_2O_5, called in the hydrated state *arsenic acid.* This compound is prepared by oxidising arsenious oxide with nitric acid, also by passing chlorine into aqueous arsenious acid. Arsenic oxide forms three hydrates analogous to phosphoric acid —monhydrate ($HAsO_3$), dihydrate ($H_4As_2O_7$), and trihydrate (H_3AsO_4); the last forms salts isomorphous with the phosphates. Arsenic oxide, when strongly heated, is decomposed into arsenious oxide and oxygen, and is reduced to metallic arsenic by charcoal or cyanide of potassium at red heat. Sulphurous anhydride, SO_2, reduces As_2O_5 to As_2O_3. Hydrosulphuric acid, H_2S, passed through a warm solution, acidified with hydrochloric acid, of arsenic acid or of an arsenate, gives a precipitate of $As_2S_3 + S_2$. Arsenic oxide is used in dyeing and in preparing aniline colours. The salts of arsenic acid are called *arsenates* or *arseniates.* The salt of magnesium and ammonium is a white crystalline salt like the corresponding phosphate. Nitrate of silver gives a brick-red precipitate, and with basic acetate of lead a white precipitate, which is reduced by heating with charcoal with evolution of arsenic, recognised by the garlic-like smell.

ar-sĕn′-ĭc-al, *a.* [Eng. *arsenic* (adj.), and suff. *-al.* In Fr. & Port. *arsenical.*] Pertaining to arsenic; having arsenic as one of its constituents.

Arsenides fused with sulphur and an alkaline carbonate yield a sulpharsenite or sulpharsenate of the alkali metal, and the other metal remains as a sulphide free from arsenic.

ar-sĕn-ĭ-ō-sĭd′-ĕr-īte, *s.* [Eng., &c., *arsenio* (q.v.); and *siderite*, from Gr. *σίδηρος* (*sidēros*) = iron.] A mineral, called by Glocker *arsenocrocite*, it being his belief that arseniosiderite was so alike in sound to arsenosiderite that it was expedient to alter one of these terms, and arseniosiderite had the precedence in time. [Arsenosiderite.] It is a fibrous species of a yellow golden colour and a silky lustre. Hardness, 1—2; sp. gr., 3·520—3·88. Compos.: Arsenic acid, 37·9; sesquioxide of iron, 42·1; lime, 11·1; water, 8·9 = 100. It occurs in France.

ar-sēn′-ĭ-ŏŭs, *a.* [Eng. *arsenī(c);* suff. *-ous.*] Pertaining to arsenic; having arsenic as one of its constituents.

arsenious oxide, or **arsenious anhydride,** As_2O_3, called in the hydrated state *arsenious acid.* It is formed by burning arsenic in the air, but is obtained by roasting arsenical pyrites, ores of tin, cobalt, &c., which contain arsenic, in a furnace supplied with air, and condensing it. Arsenious oxide crystallises in octohedra. It volatilises at 218° C. If it is condensed on a hot surface it fuses into a vitreous form, which is more soluble in water than the crystalline variety. One part dissolves in twelve parts of hot and thirty parts of cold water; no definite hydrate exists. It is insoluble in alcohol and ether. Arsenious oxide is a violent irritant poison, two grains producing death, but by commencing with small doses it is possible to take even four grains without injury. The Tyrolese eat arsenic to increase the power of the respiratory organs, as they have to climb mountains. Arsenious oxide is used in medicine in small doses in skin diseases. It is rapidly absorbed into the blood when it is applied to a wound. The best antidote is obtained by adding magnesia to ferric chloride; the mixture of sesquioxide of iron and magnesia can be used at once, without washing it. Arsenious oxide reduces chromic acid, manganic acid, &c.; but it is reduced to metallic arsenic by potassium, charcoal, sulphur, and phosphorus at red heat. Arsenious oxide unites with bases forming *arsenites*, but they are not very stable compounds. Their solutions give a *yellow* precipitate with argentic nitrate, soluble in acetic acid, also in caustic potash; a *light-green* precipitate (Scheele's green) with cupric salts. *Aceto-arsenite* of copper (Schweinfurt green) is used as a pigment for wall papers, and is very poisonous. Arsenite of sodium, formed by dissolving As_2O_3 in caustic soda, is used to prepare the papers to poison flies. Arsenious oxide is used to poison rats and as a flux for glass, also in calico printing and for making pigments. Arsenites are decomposed by heat. Hydrosulphuric acid (H_2S) gives a yellow precipitate, As_2S_3, from a solution of an arsenite in hydrochloric acid.

If a person, by maliciously setting fire to an inhabited house, cause the death of one or more of the inmates, the deed is murder, and capital punishment may be inflicted. When no one is fatally injured, the crime is not capital, but is still heavily punishable; it is a penal offence also to attempt to set a house on fire, even if the endeavour do not succeed.

A. *Ordinary Language:*

I. *Subjectively:*

1. Skill, dexterity, tact in planning and in carrying out a project.

"It is not strength, but *art*, obtains the prize."
Pope: Homer's Iliad, bk. xxiii. 383.

II. *Objectively:* The results of such skill or dexterity. *Specially—*

1. The principles of science practically carried out: a series of rules designed to aid one in acquiring practical skill or dexterity in performing some specified kind of work, manual or mental. The several arts may be arranged in two groups—(*a*) the *mechanical*, and (*b*) the *liberal* or *fine arts.* The *Mechanical Arts* are those which may be successfully followed by one who does not possess genius, but has acquired the facility of working with his hands, which long practice imparts. Such are the arts of the carpenter, the blacksmith, the watchmaker, &c. They are often called *trades.* The *Liberal* or *Fine Arts* are such as give scope not merely to manual dexterity, but to genius; as music, painting, sculpture, architecture, &c.

"But it is assuredly an error to speak of any language as an *art* in the sense of its having been elaborately and methodically formed."—*Darwin: Descent of Man* (1871), vol. i., pt. i., p. 61.

"They employed every *art* to soothe and to divide the discontented warriors."—*Macaulay: Hist. Eng.*, ch. i.

4. Whatever has been made by man, as opposed to what is natural.

"Elsewhere we find towns, like St. Petersburg, built on artificial foundations, but the whole country of the Dutch is a work of *art.*"—*Times*, Nov. 11, 1876.

B. *Technically:*

Mediæval Education: The "arts" signified the whole circle of subjects studied by those who sought a liberal education. This included science as well as art. The seven liberal arts were thus divided: 1. The *Trivium*—viz., Grammar, Rhetoric, and Logic. 2. The *Quadrivium*—viz., Arithmetic, Music, Geometry, and Astronomy. It is a remnant of this classification, which was in vogue as early as the fifth century, that we still speak of the curriculum of arts at a university, and that graduates become bachelors or masters of "arts."

"Four years spent in the *arts* (as they are called in colleges) is, perhaps, laying too laborious a foundation."—*Goldsmith: On Polite Learning*, ch. xiii.

"One may be guilty of a crime not only by perpetrating it, but by being accessory to or abetting it; which is called, in the Roman law, *ope et consilio*, and in ours, *art and part.* By *art* is understood the mandate, instigation, or advice, that may have been given towards committing the crime; *part* expresses the share that one takes to himself in it by the aid or assistance which he gives the criminal in the commission of it."—*Erskine: Institutes*, Bk. IV., iv. 10.

2. *Fig.:* Share, participation.

art-union, *s.* A union of persons interested in art [ART, II. 2], and who desire to promote it specially by purchasing the pictures of meritorious artists. These are generally distributed to the members by a lottery, which is legal in this case, though the reverse in most others. There is an art-union in London, and others exist in some of the leading provincial cities.

ar-tĕr-ĭ-ŏt′-ō-mў, *s.* [In Fr. *artériotomie;* Sp., Port., & Ital. *arteriotomia;* Lat. *arteriotomia;* Gr. ἀρτηριοτομία (*artēriotomia*), from ἀρτηριοτομέω (*artēriotomeō*) = to cut the windpipe or artery; ἀρτηρία (*artēria*) = artery, and τομή (*tomē*) = a cutting; τέμνω (*temnō*) = to cut.] The operation of making an incision in an artery and drawing blood.

ar-tĕr-ī′-tĭs, *s.* [Eng. *arter(y); -itis.*] Inflammation occurring in the arteries. It may be acute or chronic. Its anatomical characters are redness of the internal membrane of the heart and arteries, an effusion of plastic, pseudo-membranous lymph on its surface, and thickening and ulceration of its substance. In chronic, which is much more common than acute inflammation, the internal membrane of the artery is thickened, softened, and coloured a deep dirty red, especially in the vicinity of calcareous and other degenerations. (*Dr. J. Hope: Cycl. Pract. Med.*)

ar′-tĕr-ў, *s.* [Ger. *arterie;* Fr. *artère;* Sp., Port., Ital., and Lat. *arteria;* Gr. ἀρτηρία (*artēria*) = the windpipe or trachea; (2) an artery, from ἀήρ (*aēr*) = air, and τηρέω (*tēreō*) = to watch over; τηρός (*tēros*) = a watch, a guard. So called because the ancients, finding that, in the dead bodies which they examined, the arteries were empty of blood, took up the very erroneous notion that they were designed for the circulation of air through the system. Thus Cicero says, "Spiritus ex pulmone in cor recipitur et per arterias distribuitur, sanguis per venas." (Cicero, *De Nat. Deorum*, ii. 55, 138.) This error was not shaken by Herophilus.] One of the vessels designed to convey the blood from the heart. The arteries are long cylindrical tubes, with three coats, an external tunic commonly called the cellular coat, a middle or fibrous tunic or coat, and an epithelial tunic. The coating of the arteries is very elastic. The largest arteries which leave the heart are the aorta and the pulmonary artery; both spring from the base of the heart in front. They branch and anastomose to a large extent. The contractility of the arteries forces the blood to the extremities from the heart, the valves of which prevent its return. "The prominent difference between blood drawn from the arteries and that from the veins is to be found in the bright scarlet colour of the former and the dark red, almost black, of the latter." (*Todd and Bowman: Physiol. Anat.*, vol. ii., p. 310.)

"The chief *arteries* so frequently run in abnormal courses that it has been found useful for surgical purposes to calculate from 12,000 corpses how often each course prevails."—*Darwin: Descent of Man*, vol. i. (1871), pt. i., ch. iv.

Ar-tē′-şĭ-ăn, *a.* [In Fr. *Artésien.*] Pertaining to Artois, an old province of France. [ARRAS.]

Artesian well. A well of a type copied from those in use in Artois, though it is said that similar ones previously existed in Italy, Egypt, China, and probably elsewhere. If at any place the strata bend into a trough or basin, with its concavity upwards, and if two impermeable beds are separated by one or more strata which water can penetrate, then the rain will percolate into the porous beds at any point where an outcrop takes place, and, prevented from moving far up or down by the impermeable strata, will accumulate till it reaches the outcrops. If now a bore be made in the centre of the basin the water will be forced up by that standing at a higher level than itself, and may reach or even rise above the surface of the ground. Artesian wells now exist very widely in the United States and Europe.

In English *a* or *an*, the former used before a consonant sound, and the latter before a vowel one, is called the *indefinite article*, because it does not define or limit the exact person or thing to which it points; and *the* is called the *definite article*, because it does thus define or limit the person or thing which it indicates. IV. *Theology, Church History, Civil History, and Law. The Thirty-nine Articles:* "Articles of Religion," amounting to that number, framed and adopted as the recognised creed of the English Church during the progress of the Reformation struggle, having been "agreed upon by the Archbishops of both provinces and the whole clergy," first in a Convocation held in 1562, and then in another in 1571. The ratification of successive sovereigns was also given, the first of them, in conformity with the spirit of the age, adding, "from which" [Doctrine and Discipline of the Church of England now established] "We will not endure any varying or departing in the least degree." The Thirty-nine Articles give prominence to the distinctive tenets which sever the Church of England from that of Rome. They assail the supremacy of the Pope (Art. 37); the asserted infallibility of the Church of Rome and of General Councils (Arts. 19 & 21); the enforced celibacy of the clergy (Art. 32); the denial of the cup to the laity (Art. 30); transubstantiation (Art. 28); and five out of seven of the alleged seven sacraments (Art. 25); purgatory and relics; the worship of images (Art. 22); and finally, works of supererogation (Art. 14). The Thirty-nine Articles agree in doctrine, as distinguished from discipline, with those of the other Protestant communions at home and abroad. Assent to the Articles is required from every one who aspires to the office of a clergyman and pastor in the English Church. Till lately a similar subscription was demanded from every student taking a degree at one of the two oldest English Universities, but the Act 17 & 18 Vict., c. 81, removed this disability from Oxford, and the 19 & 20 Vict., c. 88, did so from Cambridge. [Degrees, Subscription.]

ar-tic-ụ-lā'-ta, *s. pl.* [Lat., n. pl. of *articulatus* = divided into joints, pa. par. of *articulo* = to divide into joints.] [Article.] Cuvier's name for the third great division or sub-kingdom of animals. The species so designated have their body divided into rings, with the muscles attached to their interior. Their nervous system consists of two cords extending along the under part of their body, and swelled out at regular intervals into knots or ganglia. One of these is the brain, which is not much larger than the other ganglia. Cuvier divided the Articulata into four classes, arranged in an ascending order—the Annelida, the Crustacea, the Arachnida, and the Insecta. Professor Owen includes under the province Articulata four classes—(1) Annulata, (2) Cirripedia, (3) Crustacea, and (4) Insecta. With the insects proper he combines also the Myriapoda, or Centipedes, and the Arachnida, or Spiders. (*Owen: Palæont.*, 1860.) The name Articulata (jointed animals) being a somewhat inaccurate one, Annulosa (ringed animals) has been substituted for it by Macleay and other naturalists. Prof. Huxley divides Cuvier's Articulata into Annuloida and Annulosa (q.v.). (See also Arthropoda.)

(*b*) *Artificial numbers:* Logarithms.

4. *Bot. The artificial system of classification:* That of Linnæus, founded mainly on the number of the stamens and pistils; the chief aim being to facilitate the naming of specimens, and not to rank together the plants which are most closely akin. The Natural as opposed to the Artificial System makes this latter object its special one, and the classification of Linnæus, which in its day rendered immense service in popularising Botany, has now all but sunk into disuse.

† **B.** *As substantive:* Anything produced by art.

"There ought to be added to this work many and various indices, besides the alphabetical ones; as, namely, one of all the *artificials* mentioned in the whole work."—*Sir W. Petty: Advice to S. Hartlib*, p. 19.

III. The men constituting the military corps in charge of the cannons, and who are trained to fire them in war.

"But there was no regiment of *artillery*, no brigade of sappers and miners, . . ."—*Macaulay: Hist. Eng.*, ch. iii.

B. *Technically:*

Mil.: For the several uses of the word *artillery*, see A., I., II., & III. James, in his *Military Dict.*, considered the artillery in the sense A., III. as consisting of (1) the Royal Regiment of Artillery, (2) the Royal Horse Artillery, (3) the Royal Artillery Drivers, and (4) the Commissary's Department. It is now often divided into (1) Horse Artillery, (2) Field Artillery, and (3) Garrison Artillery. 2. One trained to practise a manual art; a handicraftsman, a mechanic, a tradesman.

¶ This meaning, though not the original one, has still long existed; for instance, Bullokar, in the edition of his *English Expositor*, published in 1656, defines an artisan to be "A handy crafts-man; an artificer."

"Even in the towns the *artisans* were very few."—*Macaulay: Hist. Eng.*, ch. xii.

I. *Of a person's profession, occupation, craft, or study:*

* 1. One who has had a liberal education, or at least is a reader, and has in consequence acquired knowledge, as contradistinguished from one who is unread.

"The wise and fool, the *artist* and unread."—*Shakesp.: Troilus & Cressida*, i. 3.

¶ It was used especially (*a*) for a cultivator of classical learning:

"Some will make me the pattern of ignorance for making this Scaliger the pattern of the general *artist*."—*Fuller: Holy State*, bk. ii., ch. 4. (See *French: Select Glossary*, pp. 5, 9.

Tennyson: Ode to Memory, 8.

* II. One who is possessed of trained skill in any art or occupation, as distinguished from one who is destitute of such training. (*Lit. & Fig.*)

"It is not strength, but art, obtains the prize,
And to be swift is less than to be wise,
Tho' more by art than force of numbers stands
The dexterous woodman shakes the stubborn sands
By art the pilot, through the boiling deep,
And howling tempest, steers the fearless ship:
And 'tis the *artist* wins the glorious course,
Not those who trust in chariots and in horse.
[illegible] the [illegible] [illegible] of the
And [illegible] [illegible] [illegible] [illegible]

BREAD-FRUIT TREE.

middle-sized tree, with large variously-cut and lobed leaves. It has a round, curiously-muricated fruit. [BREAD-FRUIT.] It flourishes in the South Sea Islands. Dampier, Anson, and Captain Cook made it known in Europe, and the expedition of Captain Bligh of the *Bounty*, dispatched with the view of introducing it into the West Indies, ended in the mutiny of the crew, the capture of the vessel, and the settlement of some of the mutineers in 1790 on Pitcairn's Island, whence their descendants were transferred to Norfolk Island in July, 1856. genus of plants belonging to the order Araceæ, or Aroids. It contains six British species, the well-known *A. maculatum*, the Cuckoo-pint (meaning pretty), Lords and Ladies, or Wake-Robin. The solitary spikes of bright scarlet

berries may often be seen under hedges in winter, after the leaves and spadix have disappeared. They are poisonous. The rhizomes are used in Switzerland for soap. There is in them an amylaceous substance, which, after the acrid matter has been pressed out, may be employed in lieu of bread-flour.

Arundelian or *Oxford Marbles:* Certain marbles brought from the East by Mr. William Petty, who purchased them for Thomas, Earl of Arundel, in 1624. Arriving in London in the year 1627, they were placed in the gardens of Arundel House, which then occupied the site on which Arundel, Norfolk, Surrey, and Howard Streets, running off the Strand, in London, now stand. In 1667 the Hon. Henry Howard, grandson of the first purchaser, and afterwards Duke of Norfolk, presented the collection, which had met with Vandal treatment in London, to the University of Oxford. It was either from his ancestor or from him that the term *Arundelian*, applied to the marbles, was derived. The marbles contain the *Parian Chronicle* (q.v.).

a-rŭn'-dō, *s.* [Lat. *arundo* = a reed.] A Linnæan genus of grasses, formerly made to include several British species; but all these are by some botanists now removed from it, and placed in other genera. Bentham partly returns to the older view, and gives one British Arundo — viz., *A. phragmites*, the Common Reed. It is *Phragmites communis* of most modern botanists. It is a stout perennial, five, six, or more feet high, with a long creeping root-stock, long leaves, and a small or large panicle of flowers. It occurs in Britain in wet ditches, marshes, &c., flowering towards the end of summer and in autumn. [Ammophila, Psamma, Calamagrostis.] *A. donax* supplies material for fishing-rods, and is imported for the purpose from the south of Europe, where it is indigenous. The striped-leaved variety, formerly more common than it now is in gardens, is called Gardener's Garters.

¶ Though the form *aruspice* is given in Dictionaries, the examples cited to illustrate it, being in the plural, do not establish its existence, for *aruspices* might be the plural of the Lat. *aruspex*, as well as of the English *aruspice*.

"The second sort of ministers mentioned by Cicero, were not priests, but augurs and *aruspices*, designed to be the interpreters of the mind of the gods."—*Bp. Story on the Priesthood*, ch. 5.

Ar'-y-an, † Ar'-ĭ-an, *a. & s.* [In Sansc. *Arya* (as substan.) = (1) a tribe or nation—the Aryas; (2) in later Sanscrit (as adj.) = noble, of good family. India was called *Arya-âvarta* = the country of the Aryas. These Aryas were invading Brahmans, Kshatriyas (warriors), and Vaisyas (merchants); whilst the aborigines of India were called in the Vedas *Dasyus*. In later Sanscrit *Arya* specially meant the third or merchant class, the most numerous of the three, whence it came to stand for the whole nation. It seems to mean one who ploughs or tills, and to be connected with the Latin word *aro* = to plough, to till. It was opposed to *Tura*, in Sanscrit meaning (1) *as adj.* = swift; (2) *as substan.* = a nomad. [Turanian.] In Zend *airya* (adj.) means venerable, and (substan.) the Persian people. (The Persians and the Indian Aryans were originally the same nation.) Persia was called by Hellenicus, who wrote before Herodotus, *Aria*. Herodotus says that the Medes called themselves *Arii*. In the cuneiform inscriptions Darius denominates himself *Ariya*. Many other words, ancient and modern, appear to contain the term, as *Iran* (Persia); *Armenia*; *Aria*, in Thrace; the *Arii*, in Germany; and even our own *Erin* and *Ireland*. (See Max Müller on the *Science of Language*, 4th ed., pp. 246—255.) The word has sometimes been written *Arian;* but *Aryan* is more correct, besides having the great advantage of discriminating the term from *Arian*, pertaining to the Presbyter of Alexandria, so prominent in discussions regarding the doctrine of the Trinity.]

A. *As adjective:*

I. *Philol. & Ethnol.:* Belonging to the great family of human languages described below.

Aryan family of languages: A great family of languages, sometimes, though rarely, and not quite accurately, called *Japhetic;* more frequently designated as the Indo-European or Indo-Germanic family of tongues. They have reached a higher development than those of the second great family, the "Semitic," better described as the Syro-Arabian family, and are far in advance of the next one—that comprising the Turanian tongues. [Languages.] Like the Syro-Arabian forms of speech, they are inflectional [Inflectional]; while those of Turanian origin are only agglutinate. [Agglutinate.] Max Müller separates the Aryan family of languages primarily into a Southern and a Northern division. The former is subdivided into two classes—(1) the Indic, and (2) the Iranic; and the latter into six—(1) the Celtic, (2) the Italic, (3) the Illyric, (4) the Hellenic, (5) the Windic, and (6) the Teutonic. [See these words.] (*Max Müller: Science of Language*, vol. ii., 1871, p. 411.) It is often said that Sanscrit, spoken by the old Brahmans, is the root of all these classes of tongues. It is more correct to consider it as the first branch, and assume the existence of a root not now accessible to direct investigation. As an illustration of the affinity among the Aryan tongues, take the common word *daughter*. It is in Sw. *dotter;* Dan. *datter;* Dut. *dochter;* Ger. *tochter;* O. H. Ger. *tohtar;* Goth. *dauhtar;* Lith. *dukterę;* Gr. θυγάτηρ (*thugatēr*); Armenian *dustr;* Sansc. *duhitri;* the last-named word signifying, primarily, "milkmaid," that being the function, in the early Brahman or Aryan household, which the daughter discharged. Not only are the roots of very many words akin throughout the several Aryan tongues, but (a more important fact) so also are the inflections. Thus the first person singular of a well-known verb is in Lat. *do;* Gr. δίδωμι (*didōmi*); Lith. *dumi;* Old Slav. *damy;* Zend *dadhâmi;* Sansc. *dadâmi;* and the third person sing. present indic. of the substantive verb is in Eng. *is*, Goth. *ist*, Lat. *est*, Gr. ἐστί (*esti*), Sansc. *asti*.

". . . there exists in India a sort of rivalry between the *Aryan* languages, or rather between the three principal ones—Hindi, Marathi, and Bengali—each considering itself superior to the others."—*Beames: Compar. Gram. Aryan Lang. of India*, vol. i. (1872); *Introduction*, p. 31.

II. *Ethnology:*

1. *Gen.:* Pertaining to the old race speaking the primeval Aryan tongue [A.], or any of the numerous forms of speech which have sprung from it. The ancestors of most modern Europeans lived together as one people, speaking the primeval Aryan tongue, in Central Asia, and apparently near the Pamir steppe. Their separation took place at so remote a period that, while they seem to have known gold, silver, and copper, they were unacquainted with iron, the name of which is different in all the leading Aryan tongues. (*Max Müller, Science of Language*, vol. ii., 1871, p. 258.)

2. *Spec.:* The Aryan race which invaded India at a period of remote antiquity, possibly 1700 B.C., and still remains the dominant Hindoo race there.

B. *As substantive:* The race or races described under A., II. (q.v.).

The second Punic war brought it to one ounce; and, finally, the Papirian law fixed it at half an ounce only. At first it was stamped with a sheep, an ox, a ram, or a sow, but under the empire it had on one side a two-faced Janus, and on the other the rostrum or prow of a ship.

II. *Now (Mineralogy):*

1. A variety of Hornblende, which itself is classed by Dana as a synonym or subdivision of Amphibole. He says that the several varieties of Amphibole, and notably Tremolite and Actinolite, when they have little alumina in their composition, tend to become fibrous, in which case they are called Asbestos. Haüy regarded the fibres as rhombohedral prisms. As the etymology imports, asbestos is exceedingly infusible, at least in a mass. It contains a considerable percentage of magnesia in its composition. It occurs in many localities in Britain and elsewhere, mostly in serpentine districts. The varieties are—

(*a*) *Amianthus*, in which the fibres are so exceedingly long, flexible, and elastic, that they may be woven into cloth. [Amianthus.]

(*b*) *Common Asbestos*, with the fibres much less flexible. It is heavier than the first variety. It is dull green, sometimes pearly in lustre, and unctuous to the touch.

(*c*) *Mountain Cork*, light enough to float on water.

(*d*) *Mountain Leather*, also very light, but thinner and more flexible than the last.

Zool.: A genus of intestinal worms, the typical one of the family Ascaridæ. *A. lumbricoides*, or Round Worm, is the commonest intestinal parasite of the human species, generally occupying the small intestines; it is found also in the hog and ox. A second species, the *Ascaris* or *Oxyurus vermicularis*, is one of the most troublesome parasites of children, and occasionally of adults. It infests the larger intestines, especially the rectum. The male is two or three lines long, and the female five. (*Owen: Compar. Anatomy of the Invertebrate Animals*, 1843, pp. 66, 67, &c.)

1. The *ascending* node of the moon is that in which the moon passes from the southern to the northern side of the ecliptic. It is opposed to the *descending* node. [DESCENDING.] (*Herschel: Astron.*, § 406.) The meaning is the same in the case of a planet (§ 498).

2. The *ascending* signs of the zodiac are those through which the sun passes whilst he is approaching his greatest northern declination, the one which to us is many degrees above the horizon. They are Capricornus, Aquarius, Pisces, Aries, Taurus, and Gemini. The other six are called *descending signs.*

3. *Ascending latitude:* The increasing latitude of the moon or a planet.

II. *Anat.:* Directed upwards.

Ascending vessels: Those which carry the blood upwards, that is, from the lower to the higher parts of the body.

III. *Bot.:* Sloping upwards. (*Lindley.*)

A. *Ordinary Language:*

"By nature he knew eche *ascentioun.*"
Chaucer: C. T., 14,861.

2. *Spec.:* It is applied to the ascent of our Saviour from the earth, in view of his disciples, some time after his resurrection.

† **II.** That which ascends.

III. The distance by which anything ascends. [B, *Astron.*]

B. *Technically:*

Astron. Right ascension: The distance of a heavenly body from the first point of Aries, measured upon the equator. (*Hind.*) The arc of the equinoctial included between a certain point in that circle, called the *Vernal Equinox*, and the point in the same circle to which it is referred by the circle of declination passing through it. Or the angle included between two hour-circles, one of which, called the *equinoctial colure*, passes through the vernal equinox, and the other through the body. (*Herschel: Astron.*, §§ 108, 293.) It is opposed to *oblique ascension* (q.v.).

¶ The terms *right ascension* and *declination* are now generally used to point out the position in the heavens of any celestial object, in preference to the old method of indicating certain prominent stars by proper names or by Greek letters. By means of the transit instrument, or by an equatorially-mounted telescope, a star or planet may be readily found, when once its *right ascension* and *declination* are known. [EQUATORIAL TELESCOPE, TRANSIT INSTRUMENT.]

† *Oblique ascension:* The arc of the equator intercepted between the first point of Aries and the point of the equator which rises with a star or other heavenly body, reckoned according to the order of the signs.

Ascension-day, *s.* The day on which our Saviour's ascension is commemorated—the Thursday but one before Whitsuntide, sometimes called Holy Thursday. It is one of the six leading festivals for which services are assigned in the Liturgy.

2. *Gen.:* One who, whether he retires from active life or not, adopts habits of self-mortification.

II. *Church History:* A class of persons who, aspiring after higher attainments in holiness than other Christians, thought they would best attain their object by self-mortification. They therefore abstained from wine, flesh, matrimony, and worldly business; and moreover emaciated their bodies by long vigils, fasting, toil, and hunger. Both men and women embraced this austere mode of life. During the second century of the Christian era, when they first attracted notice, they lived by themselves and dressed differently from others, but did not altogether withdraw from the society and converse of ordinary men. During the course of the third century they gradually withdrew to the Egyptian desert, and early in the fourth (about A.D. 305) were associated by Anthony into monastic communities. Zool.: The first order of the Tunicated Class of Mollusca. It contains four families: the Ascidiadæ, or Simple Ascidians; the Clavellinidæ, or Social Ascidians; the Botryllidæ, or Compound Ascidians; and the Pyrosomatidæ, an aberrant family tending to the order Biphora. [Ascidioida.]

ăs-çĭ-dī'-ą-dæ, *s. pl.* [Ascidium.] Simple Ascidians. The typical family of the Ascidian order of Tunicated Mollusca. Professor Garrod considers them to be degenerate Vertebrata, which should be placed quite at the end of that sub-kingdom, after Amphioxus. The animals are simple and fixed; they are solitary or gregarious, with their branchial sac simple or disposed in 8—18 deep and regular folds. Their external integument is provided with two apertures, making them look like double-necked jars. When touched they squirt a stream of water to some distance. They look like shapeless cartilaginous masses. Some are highly coloured. In Brazil, China, and the Mediterranean they are eaten as food.

ăs-çĭd'-ĭ-form, *a.* [Mod. Lat. *ascidi(um)*, and Lat. *forma* = shape.] Bottle-shaped, like the leaves of Sarracenia and Nepenthes.

family, and order have recently acquired greatly-increased interest from the fact that Darwin has taken this part of the animal kingdom as his point of departure in tracing the process of development which he believes to have ultimately resulted in the production of man.

2. *Botany:* The pitcher in such plants as Sarracenia and Nepenthes. (*Lindley.*)

ăs-çĭg'-ĕr-oŭs, *a.* [(1) Gr. *ἀσκοί* (*askoi*), pl. of *ἀσκός* (Asci); (2) Lat. *gero* = to wear, to carry about.] Having asci. (*Loudon: Cyclop. of Plants; Gloss.*)

Ch. Hist.: A sect of Montanists who arose in the second century. Their name was designed to express the fact that some Bacchanals of their party believed the passage in Matt. ix. 17, which speaks of pouring new wine into new bottles, required them to blow up a skin or bag, and dance around it when inflated, which accordingly they did with suitable vigour, as an act of solemn worship.

ăs-cī'-tēș, *s.* [In Fr. *ascite*; Port. & Lat. *ascites*; Gr. *ἀσκίτης* (*askitēs*); from *ἀσκός* (*askos*) = a leathern bottle.]

Med.: Effusion of fluid of any kind into the abdomen; specially effusion of fluid within the cavity of the peritoneum, as distinguished from ovarian dropsy and dropsy of the uterus. There is an idiopathic ascites, which may be of a tonic or acute form, or of an asthenic type; and a sympathetic or consequential ascites. Another division is into active ascites, that in which there is a large effusion of serum into the cavity of the peritoneum, after undue exposure to cold and wet; and passive ascites, that produced by disease of the heart or liver.

ăs-clē'-pĭ-ăd, *s.* [In Fr. *asclépiade*; Sp. *asclepiadeo*; Lat. *Asclepiadeus.*]

Ancient Prosody: A kind of verse used by Horace and other writers, and divided into two primary types: (1) Asclepiadeus minor, consisting of a spondee, a choriambus, a dactyl, a trochee, and a cæsura, as Maēcē | nās ătăvīs || ēdītē | rēgī | bŭs (*Horace*); and (2) the Asclepiadeus major, consisting of a spondee, two choriambuses, a trochee, and a cæsura, as Quīs pŏst | vīnă grăvem | mīlĭtiam aût | paŭpĕrĭēm | crēpăt? (*Schmitz: Lat. Gram.*, 1860, p. 306.)

ăs-clē-pĭ-ą-dā'-çĕ-æ, *s. pl.* [Asclepias.] Asclepiads. An order of plants closely allied to the Apocynaceæ, or Dogbanes. Lindley places them under his alliance Solanales. They have a 5-divided persistent calyx; a monopetalous 5-lobed regular corolla; 5 stamina, with the filaments usually connate; anthers 2—sometimes almost 4—celled; the pollen at length cohering in masses, or sticking to 5 processes of the stigma; styles 2; stigma 1, tipping both styles, dilated, 5-cornered; ovaries, 2; fruit, 2 follicles, of which one is sometimes abortive; seeds numerous. Shrubs, or more rarely herbs, almost always milky, and frequently twining. Leaves entire, opposite; flowers umbellate, fascicled, or racemose. Their favourite habitat is Africa. They occur also in India, and the tropics generally. In 1846 Lindley estimated the known species at 910; now fully 1,000 are known. The milk, which in some species furnishes caoutchouc, is usually acrid and bitter, through apparently not so deleterious as that of Apocynaceæ. That of *Calotropis gigantea*, the *akund*, *yercum*, or *mudar* plant of India, has been used with effect in leprosy, elephantiasis, and some other diseases. The roots of *Cynanchum tomentosum*, and *Periploca emetica* are emetic. *Gymnema lactiferum* is the Cow-plant of Ceylon [Cow-plant]. *Pergularia edulis* and *Periploca esculenta* are eatable. *Diplopepis vomitoria* is expectorant and diaphoretic, and is used like ipecacuanha in dysentery. *Hemidesmus Indica* is the Indian Sarsaparilla [Sarsaparilla]. The leaves of *Cynanchum Argel* are used in Egypt for adulterating senna. *Marsdenia tenacissima* is employed for bowstrings by the mountaineers of Rajmahal, whilst *M. tinctoria* and *Gymnema tingens* yield an indigo of excellent quality. (*Lindley.*) [Asclepias.]

"The distichs used by Horace are—(1) The second *Asclepiadean* metre, consisting of a Glyconieus and the Asclepiadeus minor."—*Schmitz: Lat. Gram.* (1860), p. 306.

ăs-clē-pĭ-ăd'-ĭc, *a.* [Eng. *asclepiad*; *-ic.*] The same as Asclepiadean (q.v.).

ăs-clē'-pĭ-ăs, *s.* [In Fr. *asclépiade*; Ital. *asclepiade*; Sp. *asclepiada*; Lat. *asclepias*; Gr. *ἀσκληπιάς* (*asklēpias*), a plant, the Swallow-wort (*Asclepias vincetoxicum?*); from Ἀσκληπιός (*Asklēpios*), the Roman Æsculapius or Esculapius, the fabled god of medicine.] A genus of plants, the typical one of the order Asclepiadaceæ. The species are found chiefly along the eastern portion of North America, in Bermuda, &c. Though all more or less poisonous, they are used medicinally. *A. decumbens* excites general perspiration without in any perceptible degree increasing the heat of the body. It is used in Virginia as a remedy against pleurisy. Another variety, *A. tuberosa*, is a mild cathartic and diaphoretic. The root and tender stalks of *A. volubilis* create sickness and expectoration. *A. tuberosa* (Butterfly Weed) and *A. curassavica*, sometimes but incorrectly called ipecacuanha, are also medicinal plants, whilst *A. lactifera* yields a sweet copious milk used by the Indians, &c.; hence the ordinary name *milkweed*. *A. aphylla* and *stipitacea* are eatable. (*Lindley.*)

ăs'-cŏ-mў-çē'-tēș, *s. pl.* [Gr. *ἀσκός* (*askos*) = a bag, and *μύκης* (*mukēs*) = a mushroom.] A group of fungi whose spores or sporidia are contained within asci.

Views Him in all; *ascribes* to the grand cause
The grand effect; . . ." *Cowper: Task*, bk. iii.

¶ Regarding the difference between the verbs *to ascribe*, *to impute*, and *to attribute*, Crabb considers that *to ascribe* is *to assign* anything in one's estimate as the possession or the property of another; *to impute* is to form an estimate of a person, and *to attribute* is to assign a thing as a cause. What is *ascribed* is generally honourable; what is *imputed* is generally dishonourable." (*Crabb: English Synonyms.*)

Phar.: A preparation of phenol or carbolic acid designed to be used as a subcutaneous injection for the cure of phthisis; so named by its inventor, Dr. Cyrus Edson, of New York, who first announced his discovery in February, 1896. It is essentially a germicide; and, since carbolic acid is known to be fatal to the tuberculosis bacilli, which are regarded as the germs causing and promoting pulmonary consumption, it seems probable that aseptolin may be found efficacious providing it can be borne by the patient in quantities sufficient to produce the intended results. A published formula reads as follows: $C_{11}H_{16}N_2O_8$—OH—C_6H_5.

Geol. Volcanic ashes, volcanic ash: The porous remains of certain molten rocks thrown out by ancient volcanoes, and in many cases laid down in beds stratified by the gravitation of the falling bodies themselves, or by the action of water. (For example see A. 1.)

¶ For the distinction between *ashes* and *tuffs* see the subjoined example.

"In answer to the question as to what was the difference between *ashes* and tuffs, he [Mr. David Forbes, F.R.S.] defined *ashes* as purely sub-aërial formations, thrown out of the volcanic orifice, and falling down on land or sea, as the case happened; whilst tuffs, on the contrary, were molten lava poured out into, or more often under, water, and thus instantaneously quenched and disintegrated into fragments or powder, more or less fine, in proportion as the action of the water was overpowering. In *ashes* each separate particle bore on its exterior the evidence of its having been exposed to the action of fire in the throat of the volcano, and externally is altered, glazed, or coated with a crust or skin, often resembling that of a meteorite, an appearance which is never to be observed in tuffs."—*Q. J. Geol. Soc.*, vol. xxxi. (1875), p. 421.

Ash-Wednesday, *s.* [Eng. *Ash*; *Wednesday.* In Sw. and Dan. *Aske-onsdag*; Dut. *Asch-dag*; Ger. *Aschermittwoch.*] The first day of Lent, the connection of which with "ash" or ashes seems to have been that, according to the injunction of Pope Gregory the Great, in the sixth century, ashes, which first had been blessed, were sprinkled on the heads of worshippers, or the form of the cross was traced with ashes upon their foreheads, one main object at first being to put them in remembrance that their bodies were but "dust and ashes." As on the same day notorious sinners, professing penitence, had to appear in church clothed in sackcloth, and with tears solicit absolution, repentance "in sackcloth and ashes" was also suggested, and added a fresh association with the day. At the time of the Reformation the law or practice which required applicants for pardon of sin to be subjected to this severe discipline was swept away, and the "Commination" Service, still in use, was introduced in its room, "until the said discipline may be restored again, which is much to be wished." (*Liturgy: Commination.*) To a certain extent Ash-Wednesday is recognized in England by the nation as well as by the Church.

She was symbolised by the moon, and also by the planet Venus. The first modern society of the kind was the Asiatic Society of Bengal, founded at Calcutta by Sir William Jones, in January, 1784. The Royal Asiatic Society of Great Britain and Ireland was formed in March, 1823, and incorporated in August, 1824. It holds its meetings in London, but has affiliated societies or branches at Bombay and Madras. The Bengal Society also, though earlier in point of time, is now virtually a third branch. Other Asiatic Societies exist among the Continental nations, the best known being that of Paris, founded in 1822.

A. *Transitive:*

I. To solicit or demand a reply in words to a question put.

1. To question, to inquire of, to interrogate.

". . . when your children *ask* their fathers in time to come, saying, What mean ye by these stones?"—*Josh.* iv. 6.

¶ Sometimes the word *question* is put after the interrogatory verb, as—

". . . neither durst any man from that day forth *ask* him any more questions."—*Matt.* xxii. 46.

2. To inquire about, to solicit information regarding.

"*Ask* counsel, we pray thee, of God, . . ."—*Judg.* xviii. 5.

¶ *Ask* in this first sense of inquire is followed by the objective of the person, and *concerning* or *regarding* or *of* prefixed to the thing about which information is solicited.

"*Ask* now the priests concerning the law, . . ."—*Hagg.* ii. 11.

"*Ask* me of things to come . . ."—*Isa.* xlv. 11.

* II. To lay to one's charge; the original meaning probably being to demand from one an answer to a charge.

¶ Or it is followed by two objectives, the one of the person and the other of the thing:

". . . I will *ask* thee a thing; hide nothing from me."—*Jer.* xxxviii. 14.

(Properly speaking, there is an ellipsis, *of* being omitted before the person: "I will ask [of] thee.")

In the sentence, "Ask us a king" (1 Sam. xii. 19), there seems an ellipsis of *for*: "Ask [for] us a king."

¶ Or it is followed by the objective of the thing, and *of*, *from*, or *at* of the person the last named:

"*Ask* thee a sign of the Lord thy God; . . ."—*Isa.* vii. 11.

Or before a noun of multitude *among* may be used.

A. *Ordinary Language:*

† **I.** The act of looking, a glance.

"The tradition is no less ancient, that the basilisk killeth by *aspect*, and that the wolf, if he see a man first, by *aspect* striketh a man hoarse."—*Bacon: Nat. Hist.*, Cent. x., § 924.

II. The appearance presented.

1. *Of persons:*

(i.) *Gen.:* Countenance, look, also mien. (Applied to a man, or at least to a living being.)

"Which when Beelzebub perceived, than whom Satan except, none higher sat, with grave *Aspect* he rose, . . ." *Milton: P. L.*, bk. ii.

(ii.) *Spec. Figuratively:* (In the astrological sense.) [B. 2.]

Which triumphed in that sky of his delight,
Where mortal stars, as bright as heaven's beauties,
With pure *aspects* did him peculiar duties."
Shakesp.: Tarquin and Lucrece.

2. *Of things:*

(i.) *Of material things:* The appearance presented by a place; also the adaptation which a building or other station possesses for affording an outlook in any particular direction. (Used with more or less tacit allusion to the astrological sense.)

"The character, thus formed, has two *aspects*."—*Ibid.*, ch. xii.

B. *Technically:*

1. *Old Astron.:* The position of a planet in the heavens, especially with respect to other planets. Five different aspects received names. If two planets had the same longitude, they were said to be *in conjunction*; if 60° apart, the aspect was *sextile*; if 90°, *quartile*; if 120°, *trine*; if 180°, then the two bodies were said to be *in opposition*. The symbols were the following:—

Conjunction	☌.
Sextile	⚹.
Quartile	□.
Trine	△.
Opposition	☍.

Of these terms only the first and last are now retained. [Conjunction, Opposition.] In the subjoined example, *square* is the same as *quartile*, and *opposite* means in *opposition*.

"To the blank moon,
Her office they prescrib'd: to th' other five,
Their planetary motions and *aspects*,
In sextile, square, and trine, and opposite.
Milton: P. L., bk. x.

2. *Astrol.* This pseudo-science, recognising the different aspects of the planets described under No. 1 (*Old Astron.*), further superadded the notion that these could, on the one hand, exert good, and on the other, an evil or malign influence on human affairs.

". . . if Nature's concord broke,
Among the constellations war were sprung,
Two planets, rushing from *aspect* malign
Of fiercest opposition, in mid sky
Should combat, and their jarring spheres confound." *Milton: P. L.*, bk. vi.

". . . and the astrologers call the evil influences of the stars evil *aspects*."—*Bacon: Essays (Civil & Mor.)*, ch. ix.

3. *Her.:* The position which an animal occupies with regard to the eye of the spectator. It may be (1) *full aspect*, that is, full-faced, looking towards the spectator; or (2) *passant* that is, with its side towards him; or (3) of *trian aspect*, that is, neither the one nor the other, but between the two.

4. *Painting. A double aspect:* A single figure representing two or more different objects. (*Glossog. Nova.*)

* **ąs-pĕct',** *v.t.* [From *aspect*, s. (q.v.).] To look at, to behold, to contemplate.

sides. The tremulous movement of the leaves which exists in all the poplars, but culminates in the aspen, mainly arises from the length and slender character of the petiole or leaf-stalk, and from its being much and laterally compressed. The aspen is more unequivocally a native of Britain, and especially of Scotland, than the other poplars, being often found in the middle of large woods remote from cultivation.

Greek Grammar: The rough breathing (Lat. *spiritus asper*) (῾) placed over the initial letter of many Greek words, when that letter is itself a vowel, and over the second letter if a diphthong. It indicates that the vowel is to be aspirated, *i.e.*, pronounced as if *h* preceded it, as ἵππος (*hippos*). It is used also before ρ, at the beginning of a word, to indicate that it should be pronounced like *rh*, as ῥόδον (*rhodon*). When a double ρ occurs in the middle of a word, some authors mark the first with the soft breathing (Lat. *spiritus lenis*), and the second with the rough one, as ἔῤῥινον (*errhinon*). Liddell and Scott generally omit ᾽, writing the word simply ἔρρινον; but whether ᾽ be inserted or omitted, the second ρ must be pronounced with an aspirate.

Mahu deems it of Phenician origin; but in Hebrew, which is closely akin to Phœnician, *asphalt* is חֵמָר (*chémar*) (Gen. xi. 3; xiv. 10; Exod. ii. 3), which is from quite another root.]

A. *As substantive:*

I. *Ordinary Language* (*of the forms* asphalt, asphalte, *and* † asphaltus): Bitumen, Jews' pitch.

1. The mineral substance described under II. 1.

"Unwholesome fogs hang perpetually over the lake, and the stagnant surface is broken by clots of *asphaltus,* which are constantly bubbling up from the bottom."—*Milman: Hist. Jews,* 3rd ed., bk. i., vol. i., p. 17.

2. The artificially-made substance described under II. 4.

II. *Technically:*

1. *Mineralogy* (*of the form* asphaltum): A mineral placed by Dana in the Appendix to his Hydro-carbons. Pliny called it *bitumen,* a name still in common use. More specifically, it is compact bitumen. It has been termed also *mineral pitch* and *Jews' pitch.* It is amorphous; the spec. grav., 1—1·8; the colour, brownish black and black; the lustre, pitchy; the odour, bituminous, especially when it is rubbed. There are more fluid and more solid kinds of it. It melts at 90° to 100° C., and burns with a bright flame. It may be dissolved either in whole or in part in oil of turpentine, ether, or alcohol. It consists of oils, vapourable at different temperatures, resins, black or brownish-black substances, and others of a nitrogenous character. It contains about eighty per cent. of carbon, eight or nine per cent. of hydrogen, with varying proportions of oxygen, nitrogen, and ash. It exists in and along the shores of the Dead Sea, which was thence called Lake *Asphaltites* or *Asphaltitis.* (*Josephus: Wars,* bk. iv., ch. viii.) The "slime-pits" with which the "vale of Siddim" was "full," were of asphalt (Gen. xiv. 10). It also constituted both the "slime" and the "pitch" (there is only one substance mentioned in Hebrew) with which the ark of bulrushes designed for the reception of the infant Moses was daubed (Exod. ii. 3). It was found at Hit, above Babylon, on the Euphrates, and was the "slime" which the builders of the tower of Babel employed instead of mortar (Gen. xi. 3). It occurs also near the Tigris and in the Caucasus. In America, it is met with in the island of Trinidad, where a large lake of it exists [see **A.**, **II.** 2]; in Peru, and in California. In Europe it is found in the island of Zante; in Albania and Dalmatia; in Carinthia; in the Harz, in Germany; in France; and abundantly in the Val de Travers, in the Canton of Neufchatel, in Switzerland; besides small quantities in our own country, in Derbyshire, Cornwall, and Shropshire. [BITUMEN.]

2. *Geol.* (*chiefly of the forms* asphaltum *and* asphalt). Asphaltum is apparently of vegetable origin. Treating of the pitch lake of Trinidad, Sir Charles Lyell mentions that fluid bitumen is seen to ooze from the bottom of the sea on both sides of the island of Trinidad, and to rise up to the surface of the water. He also states, on the authority of Gumilla, that "about seventy years ago" [about 1780?] a spot of land on the west coast of Trinidad sunk suddenly, and was replaced by a small lake of pitch. The celebrated "Pitch Lake" may have had a similar origin. The Orinoco has for ages been rolling quantities of vegetable matter into the adjacent ocean. Subterranean fires may have converted them into petroleum, which, being forced upwards by similar causes, has been inspissated and transformed into different varieties of asphaltum. (*Lyell: Princip. of Geol.,* ch. xvii., 8th ed., 1850.) It occurs in rocks of various ages, but most abundantly in those of very recent date.

3. *Chem.* (*of the forms* asphalt *and* asphaltum). Asphalt is said to consist chiefly of a substance called by Boussingault *asphaltene.* [ASPHALTENE.] Dana, however, considers Boussingault's conclusions as by no means finally established.

4. *Art and Commerce:*

(*a*) Most of the asphalt of antiquity was brought from the Dead Sea. The Egyptians

used it in embalming their dead. Solid asphalt is still used in Arabia, Egypt, and Persia instead of pitch for ships, and the fluid asphaltum for varnishing and for burning in lamps. It is also used for covering roads and pavements, being smooth, impermeable to water, and durable. Much, however, of the asphalt used for covering streets, pavements, bridges, roofs, &c., in American and European cities, is not that of nature, but is manufactured artificially from bitumen, pitch, and gravel, or from a brown bituminous limestone found near the Jura mountains. When employed for paving, it is melted in large iron caldrons and laid down hot, that it may consolidate into a continuous sheet of impermeable material. It is the same as asphaltic mastic.

(*b*) A composition of asphalt, lamp black, and oil of spike, or turpentine, used for drawing black figures on dial-plates. (*Nicholson.*) (*Webster's Dict.*)

B. *As adjective:* Pertaining to asphalt; consisting of, or at least containing asphalt.

asphalt-like, *a.* Like asphalt.

ăs-phăl′-tēne, *s.* [Eng., &c., *asphalt;* suff. *-ene.*]

Chem.: Boussingault's name for a substance which consists for the major part of asphalt. Its formula is $C_{20}H_{32}O_2$. It arises probably from the oxidation of petrolene. [ASPHALT, A., II. 3.] (*Fownes: Man. of Chem.,* 10th ed., p. 586.)

Possibly from ἀ, priv., and σφάλλω (*sphallō*) = to balk, to foil. In this case it would mean a flower which cannot be balked or foiled when in competition with others. Now corrupted into *daffodil.*]

A. *Ord. Lang.* (*of the form* asphodel): The English name of the plants belonging to the genus Asphodelus (q.v.). The yellow and white species were introduced into this country during the sixteenth century—the former about the year 1596, and the latter in 1551. Immense tracts of land in Apulia are covered with white asphodel, which affords good nourishment to sheep. The asphodels, being sacred to Proserpine, were used in classic times in funeral ceremonies, and the souls of the departed were supposed by the poets to wander in meadows adorned with these beautiful flowers.

About eight species are familiar, and are cultivated in English gardens, the best known being *A. luteus,* the Yellow; *A. albus,* the White; and *A. ramosus,* the Branched Lily or Asphodel, called also King's Rod.

1. *Originally:* Syncope, fainting.

2. *Now.* Suspended animation: An interruption of the arterialisation of the blood, causing the suspension of sensation and voluntary motion. It may be produced by breathing some gas incapable of furnishing oxygen, by submersion under water, by suffocation, from an impediment to breathing applied to the mouth and nostrils, by strangulation, or by great pressure, external or internal, upon the lungs. ạs-săs′-sĭn, As-săs′-sĭn, *s.* [In Ger. *Assassinen* (pl.); Fr. & Prov. *assassin*; Sp. *asesino*; Port. & Ital. *assassino* (all sing.); Arab. *Haschischin* = as substantive, a member of the sect described under No. 1; as adj., inspired by *haschisch*, an intoxicating liquid or drug called in India *bhang*, prepared from the powdered leaves of *Cannabis sativa*, or Common Hemp. Many Eastern desperadoes, when they wish to do some nefarious deed, deaden what remnants of conscience they possess and stimulate their passions by means of this bhang. (Bhang.) Some etymologists derive *assassin* from Hassan ben Sabah, the founder of the order (I., 1).]

I. *Literally:*

1. *Hist.:* A military and religious order which constituted an offshoot from the Ismaili branch of the great Shiah sect of Mohammedans. It was founded in A.D. 1090 by Hassan ben Sabah, at the hill fort of Alamoot, in Persia. A section of them afterwards removed from Persia to Mount Lebanon, where they came in contact with the crusaders, and through them acquired infamous notoriety in Europe. By the rules of their founder, they were bound implicitly to carry out the commands of their chief (popularly known in the West as the "Old Man of the Mountain"), even to the extent of murdering any king or inferior person in Europe, Asia, or anywhere, with whom he might have a quarrel. Several proud potentates are said to have paid him black mail for safety's sake; but the gallant Knights Templars had more of a kingly spirit, and defied his power. The Mongols made a general massacre of the Persian branch of the order in 1256, and Sultan Bibars all but rooted out the Syrian offshoot in 1270, but traces of them are said still to exist in both countries, especially at Kalat el Masryad, in Persia. Despite their origin, the Assassins were not pure Shiahs in faith; their religion was a mixture of Magianism, Judaism, Christianity, and Mohammedism. There was a certain resemblance between their tenets and those of the Druses in Mount Lebanon.

2. A ruffian who, either from personal animosity, or from having been hired to do the atrocious deed, murders one by open violence or by secret or sudden assault.

1. To murder by open violence or by secret and sudden assault.

To *assassinate* so great, so brave a man?"

¶ Sometimes it is only half-seriously applied to the inferior animals, as Cowper does it to a tame bullfinch killed by a rat.

"Oh, share Maria's grief!
Her favourite, even in his cage,
(What will not hunger's cruel rage?)
Assassinated by a thief."

A. *Ordinary Language:*

I. *Lit.:* A violent attack made upon any person, persons, or place, with the hands or with material weapons. [B., 1, 2, 3.]

"They resisted his *assaults* desperately, and obliged him to turn the siege into a blockade."—*Arnold: Hist. Rome*, ch. xliv.

II. *Figuratively:*

1. (In which the attacking force consists of a person or persons.)

(*a*) An attack by means of a charge against one; abusive language, calumny, &c.

"After some unhappy *assaults* upon the prerogative by the parliament, which produced its dissolution there followed a composure."—*Clarendon.*

(*b*) An attack upon one's virtue, which may be by seduction rather than violence.

(*c*) An attack upon a thing, as upon a religion, an opinion, &c.

"Theories built upon narrow foundations are very hard to be supported against the *assaults* of opposition."—*Locke.*

2. (In which the attacking force is a thing.) An adverse natural force brought to bear upon a person or thing.

"... and unshaken bears the *assault*
Of their most dreaded foe, the strong south-west."
Wordsworth: Excursion, bk. v.

B. *Technically:*

1. *Mil.:* A furious effort to carry a fortified post, camp, or fortress, where the assailants do not screen themselves by any works. (*James.*) It is the appropriate termination of a siege which has not led to the capitulation of the garrison.

3. *Law:* A movement which virtually implies a threat to strike one, as when a person raises his hand or his cane in a menacing manner, or strikes at another but misses him. In common law it is not needful to touch one to constitute an assault. When a blow actually takes effect the crime is not simple assault, but assault and battery. If two people fight in private, they are held to have committed assaults on each other; but if they do so in public, they are chargeable with affray. [See AFFRAY.] A person assaulting another may be prosecuted by him for the civil injury, and may also be punished by the criminal law for the injury done to the public. (*Blackstone: Comment.*, bk. iii., chap. 8; iv., chaps. 11, 15.)

¶ In *Scots Law* the word *assault* has a somewhat more comprehensive sense than in England, the word *battery* not being used; but what is here called *assault and battery* is in Scotland regarded simply as a more aggravated kind of assault.

ạs-sâ'ult, *ạs-sâ'ut, *v.t.* [O. Fr. *assaulter.* In Sp. *asaltar, assaltar, assaltear;* Ital. *assaltare;* Low Lat. *assalto.*] [ASSAULT, *s.*]

B. *Technically:*

I. *Chemistry:*

1. The determination what percentage of a metal, especially of a precious one, is in any particular ore or alloy. An *ordinary* or a *simple assay* is designed to ascertain how much a compound of gold or silver varies from the prescribed standard, whilst a *parting assay* is designed to separate the two metals from each other in the specimen examined, that the proportion in the bullion of which it is a fair sample may be ascertained. In a *gold parting assay*, the amount of silver in the gold is ascertained; and in a *silver parting assay*, the amount of gold in the silver. [ASSAYING, TOUCH.] The analysis, or *assay*, of an alloy of gold and copper is usually made by cupellation with lead. The weight of the button remaining on the cupel gives directly the amount of gold in the alloy after certain corrections similar to those required in the case of silver. (*Graham: Chem.*, 2nd ed., vol. ii., p. 362.)

2. The alloy or metal assayed.

"... like an *assay* fused before the blow-pipe."—*Darwin: Voyage round the World*, ch. iii.

II. *Law:* The examination or testing of the weights and measures of this or any other country by a fixed standard.

A. *Transitive:*

I. To try anything or any person.

1. *Of things:*

(*a*) In the same sense as No. II. (q.v.).

* **II.** To proffer.

B. *Intrans.:* To attempt, to endeavour.

"... a confidential man of business, a practical miner and *assayer*, would have been all that was required."—*Darwin: Voyage round the World*, ch. xvi.

ạs-sā'y-ĭng, * ạ-sā'i-ỹnge, *pr. par.* & *s.* [ASSAY, *v.*]

As substantive: The act or process of subjecting coins, quantities of bullion, or alloys, to examination and experiment, with the view of ascertaining what proportion of each of the precious metals they contain. The proportion in gold coin in the British Isles is $\frac{11}{12}$ of gold and $\frac{1}{12}$ of alloy. This is called the *standard.* That it is actually reached is proved by the *Trial of the Pyx*, which from time to time takes place. [PYX.] The process adopted to assay the precious metals is *cupellation* (q.v.). The assayer's work has been much facilitated by the discovery that the application of sulphuric acid can separate gold and silver. The French call cupellation the *dry method* of assaying, and adopt another of their own called the *humid* one. [ASSAY.]

"This method is also sometimes used in the *assaying* of coins to afford an indication of the quantity of silver required in the cupellation."—*Graham: Chem.*, 2nd ed., vol. ii., p. 362.

II. *In an active sense:* That which convokes. [B. 2, *Mil.*]

B. *Technically:*

1. *Church Hist., &c.:* The term now given to the highest deliberative body in some Presbyterian churches, and specially to what, when fully named, are termed the "General Assembly of the Established Church of Scotland," and the "General Assembly of the Free Church of Scotland." These consist of ministerial and lay or half-lay representatives, equal to each other in number, sent from each presbytery, and in spiritual matters discharge deliberative, legislative, judicial, and executive functions. The word *Assembly*, in this second sense, seems to have been introduced into Scotland from France, whilst the natives of the former country had much intercourse with Calvin. From Scotland it passed to England, where the "Westminster Assembly" was an assembly of 121 divines who, with certain lay assessors, met at Westminster in 1643, by authority of the Parliament, with the view of attempting to produce ecclesiastical formularies which might lead to uniformity of worship in England and Scotland. It sat five years, produced the Directory of Public Worship, the Confession of Faith, and the Larger and Shorter Catechisms, and was ultimately dissolved by Oliver Cromwell.

". . . the words of the prophets declare good to the king with one *assent.*"—2 *Chron.* xviii. 12.

¶ We *assent* to what we admit to be true; we *consent* to what we allow to be done. *Assent* may be given to anything, whether positively proposed by another or not, but *consent* supposes that what is consented to is proposed by some other person. If *assent* and *consent* are both used of speculative propositions, then *assent* is the act of an individual, and *consent* that of many, as in the phrase, "By the common *consent* of mankind." Approbation, which is a much stronger word, is a species of assent and concurrence of consent. The latter term is properly used only of numbers, not of single individuals. (*Crabb.*)

Commerce & History: A contract or convention between the King of Spain and other powers for furnishing slaves for the Spanish dominions in America. The contract of the Assiento was made on March 26th, 1713.

Assiento Company: Any company entrusted with the function of fulfilling the Assiento contract. The first one which agreed to undertake the degrading task was the French Guinea Company. In July, 1713, the Treaty of Utrecht handed it over to Great Britain, and for twenty-six years the South Sea Company did something towards rendering the odious service required. But the breaking out of war in 1739 placed the Assiento contract in abeyance. It was never revived, and ultimately Britain became the mortal foe, first of the slave-trade, and then of slavery itself.

ȧs-sĭ-gnat′ (gnat as **nyăt),** *s.* [Fr.] An annuity founded on the security of lands. Specially, French Republican paper money. When the revolutionary French Assembly of 1790 took the decisive step of disendowing the church, and appropriating all ecclesiastical property to the state, the prodigious quantity of church lands, amounting to about one-third of the soil of France, thrown upon its hands could not be disposed of all at once. The labour of selling it was therefore devolved on each commune or parish, which was required to pay the proceeds, when realised, into the state treasury. Meanwhile the government, being without adequate revenue, issued paper money on the security of the funds to be paid it by the communes. The bonds issued for the purpose were called *assignats.* Ultimately over-issue of these paper notes greatly depreciated their value, so that in the year 1795, 3,000 instead of about twenty-four of them were given in change for a louis-d'or. (*Evans Crowe's Hist. of France*; *Cabinet Cyclopædia*, 1831, vol. ii., p. 304; vol. iii., p. 121.)

B. *Technically:*

I. *Law & Government:* An assembly of knights and other substantial men met at a certain place and time for the discharge of public business. In this sense, the General Council or Witenagemot of England was called the General Assize. Glanvil, who wrote in the reign of Henry II., says it had never yet been ascertained by the general assize or assembly, but was left to the custom of particular counties. (*Blackstone: Comm.*, bk. i., ch. 2.)

II. *Law:*

1. A jury, so called from their sitting together. Blackstone thinks that jury was the original meaning of the word *assize*. The *grand assize*, or grand jury, was instituted by Henry II., and might be appealed to by one who preferred it to trial by battle. (*Blackstone: Comm.*, bk. iii., chaps. 10, 22, and 23.)

2. The court which summons together such a jury by a commission of assize, or *ad assisas capiendas*. (*Ibid.*, ch. 10.)

3. The sittings held, by the commission of the sovereign, at stated intervals, by one or more judges in the county towns of England, for the trial of civil and criminal cases. [See A., I., 1 (*b*).] The judges sit on such circuits by virtue of five authorities—the commission of the peace, that of oyer and terminer, that of general gaol delivery, that of assize, and that of nisi prius. The foundation of the present system was laid by Magna Charta, and by the statute Westm. 2, 13 Edw. I., c. 30. The commission of assize was so called because it was sent to take the verdict of a particular kind of assize—that is, jury. (*Ibid.*, bk. iii., chaps. 22, 23.)

4. An action at law for recovering the possession of lands. It is applicable to no more than two species of injury—by ouster, viz., abatement [Abatement], and recent or novel disseisin. [Disseisin.] If the abatement happened upon the death of the demandant's father, mother, brother, sister, nephew, or niece, the remedy is by an assize of *mort d'ancestor*; if by that of relatives different from these, then various other terms are applied to it. *An assize of novel disseisin*—that is, of recent disseisin—does not essentially differ from that now described. These actions were called *writs of assize*. (*Ibid.*, bk. iii., ch. 10.)

¶ *A certificate of assize* was a second trial granted when a miscarriage of justice appeared to have occurred. (*Blackstone: Comm.*, bk. iii., ch. 24.)

5. A statute or ordinance. [A., II., 1, 2, 3.]

(*a*) *In a general sense:* A statute or ordinance of any kind. The *assize of arms* was an enactment of Henry II. that each person should provide arms suitable to his rank, which on his death should descend to his son or other heir.

¶ The *assize of the forest* meant rules for the management of the royal forests.

¶ *Rents of assize* are certain established rents of the freeholders and ancient copyholders of a manor, which cannot be departed from or varied. They are also called *quit-rents*. [Quit.] (*Blackstone: Comm.*, bk. ii., ch. 3.)

(*b*) *Spec.:* An ordinance for regulating the measure and price of the articles sold in the market; also one for similarly fixing the standard weights and measures.

If, for example, on walking out, one come to a spot where on a previous occasion something exciting happened, the sight of the place will almost certainly recall the occurrence. Dugald Stewart considers that the ideas which tend to suggest each other are those connected together by resemblance, analogy, contrariety, vicinity in time or in place, the relation of cause and effect, of means and of end, or of premises and conclusion.

"*Association of ideas* is of great importance, and may be of excellent use."—*Watts.*

". . . the ultimate law to which the *association of feelings* conforms."—*Herbert Spencer: Psychology*, 2nd ed. (1870), vol. i., p. 252.

2. *Science, Literature, &c.:*

The word *Association*, though not so common as *Society*, is still in general use in the sense detailed under A., III. 1. A well-known association in Britain is fully and formally designated "The British Association for the Advancement of Science," but it is generally called simply "The British Association." At its first meeting, that held in York on the 27th of September, 1831, the Rev. William Vernon Harcourt thus defined its aims:—

"I propose then, gentlemen, in the first place, that we should found a British Association for the Advancement of Science, having for its objects, to give a stronger impulse and more systematic direction to scientific inquiry, to obtain a greater degree of national attention to the objects of science, and a removal of those disadvantages which impede its progress, and to promote the intercourse of the cultivators of science with one another and with foreign philosophers."—*Brit. Assoc. Reports*, vol. i., 2nd ed. (1835), p. 22.

The British Association has since greatly developed, having now (1879) about 4,000 members. It is divided into the following sections:—Section A. Mathematics and Physics; B. Chemistry and Mineralogy; C. Geology; D. Biology; E. Geography and Ethnology; F. Statistics; G. Mechanical Science. These sections are again divided into what till 1865 were called sub-sections, but have since been termed departments. (*Brit. Assoc. Rep.*, 1877, p. xxxvi.) The association meets, on invitation being sent to it, in any of the larger towns or cities (London excepted) which can give it accommodation, doing its best at each place to communicate an impulse towards the cultivation of science which may continue to operate after it has gone.

Law:

1. A verbal promise made by any one, or which he may in justice be held to have more or less directly made. [See No. 2.] In the former case the assumpsit or promise is said to be *explicit*, and in the latter, *implied*. One may actually promise to pay a sum of money or build a house by a certain day, in which case the promise is deemed explicit, and an action lies against him if he violate his verbal engagement. Certain contracts are, however, so important that the law requires them to be in writing. *Implied promises* are such as the following:—A person, when in want of certain articles, is in the habit of obtaining them at a certain shop. Having done so, it is not legally competent for him to turn round on the shopman and say, "Prove that I ever promised to pay for the articles I received." The law rightly judges that if there was not an *explicit*, there was at least an *implied* promise to pay for the goods, else the shopman would not have given them. So also if a person contract to build a house, and erecting it in defiance of the principle of gravity, see it tumble to pieces before his eyes, he is not allowed to plead that he knew nothing of building. His having taken the contract is held to imply that he gave himself out as competent to perform the work which he undertook to do.

"... the *assumpsit* or undertaking of the defendant ... A third species of implied *assumpsits* is ..."—*Blackstone: Comment.*, bk. iii., ch. 9.

Chaucer: C. T., 4,761.

"Not a house but seems
To give *assurance* of content within."
Wordsworth: Excursion, bk. v.

(ii.) The act of "insuring one's life." [A., II. 3.]

2. The state of being assured, or being insured.

(i.) The state of being assured.

(*a*) The state of receiving statements, designed to inspire confidence either with respect to one's personal security or any other matter which else would be doubtful.

"We have as great *assurance* that there is a God, as we could expect to have, supposing that he were."—*Tillotson.*

¶ *To take assurance from an enemy:* To submit on condition of receiving protection. (*Scotch.*)

(*b*) Firm belief in such statements, unwavering conviction.

"Such an *assurance* of things as will make men careful to avoid a lesser danger, ought to awaken men to avoid a greater."—*Tillotson.*

(*c*) Confidence, trust, produced by such conviction.

"Thou shalt fear day and night, and shalt have none *assurance* of thy life . . ."—*Deut.* xxviii. 66.

"And the work of righteousness shall be peace; and the effect of righteousness quietness and *assurance* for ever."—*Isa.* xxxii. 17.

¶ *To make assurance doubly sure:* To take steps which seem much more than sufficient to remove every cause of apprehension, and produce tranquil confidence.

"*Macb.* Then live, Macduff: what need I fear of thee,
But yet I'll make *assurance doubly sure.*"
Shakesp.: Macbeth, iv. 1.

(*d*) The confidence produced by comparing one's self with others. This may be moderate, and therefore legitimate; indeed, it may be only the absence of false modesty or overbashfulness.

"Men whose consideration will relieve our modesty, and give us courage and *assurance* in the duties of our profession."—*Rogers.*

"With all th' *assurance* innocence can bring,
Fearless without, because secure within."
Dryden.

Or it may be immoderate and become forwardness or impudence.

"This is not the grace of hope, but a good natural *assurance* or confidence, which Aristotle observes young men to be full of, and old men not so inclined to."—*Hammond.*

Or again it may be supported by a feeling of duty, and become intrepidity or fortitude, which is highly commendable.

"They, like resolute men, stood in the face of the breach with more *assurance* than the wall itself."—*Knolles.*

(ii.) The state of being insured. [A., II. 3.]

3. That which is designed to render a person or thing assured or insured.

(i.) That which is designed to assure a person, or inspire him with confidence.

"*Assurances* of support came pouring in daily from foreign courts."—*Macaulay: Hist. Eng.,* ch. xx.

". . . the answer returned to these affectionate *assurances* was not perfectly gracious."—*Ibid.,* ch. xxiii.

(ii.) That which is intended to insure a person or his life, or, more truly, his property. [A., II. 3.]

"An *assurance* being passed through for a competent fine, hath come back again by reason of some oversight."—*Bacon.*

II. *Technically:*

1. *Theology:* The unwavering conviction, divinely produced, that one is now acceptable to God, and will, through the mediation of Christ, at last infallibly attain to heavenly felicity.

"And we desire that every one of you do shew the same diligence to the full *assurance* of hope unto the end."—*Heb.* vi. 11.

"Though hope be indeed a lower and lesser thing than *assurance,* yet, as to all the purposes of a pious life, it may prove more useful."—*South.*

2. *Law:* The conveyance of lands or tenements by deed; legal evidence of the conveyance of property. The legal evidences of this translation of property are called the common assurance of the kingdom, whereby every man's estate is assured to him. (*Blackstone's Comment.,* II. 294.)

3. *Arithmetic, Comm., Insurance, &c.:* The act of "insuring" a person's life; the state of being insured; also a contract between a person on the one hand and a company on the other, by which the former agrees to pay a stipulated sum at fixed times, and the latter promises a certain amount to be given over to his heirs in the event of his dying during the period for which he has paid. The sum for which the individual insured becomes responsible is called the *premium.* If given all at once it is called a *single premium;* if at the commencement of each year, an *annual premium.*

While the time of a single person's death is not ascertainable beforehand by man, the percentage of deaths out of 10,000, or 100,000, or a million, is wonderfully fixed, the variations becoming less as the number from which the percentage is calculated grows greater. It may, therefore, become the subject of arithmetical and algebraical calculation. [Annuities, Life, Expectation.]

To find the present value of £100, *to be paid at the end of the year in which the assurer, A, dies:* Find the present value of an annuity of £1 for the life of A. If this be called *a,* then (*a* + 1) multiplied by the present value of £1 due a year hence, with *a* subtracted from the result, and the remainder then multiplied by 100, will give the sum required. Or, find A's expectation of life, and calculate the present value of £100 that number of years hence.

To find the annual premium which would furnish such a sum on the death of A: Divide the present value of £100, as ascertained in the previous paragraph, by the present value of an annuity of £1 for the same time.

¶ The business of Assurance or Insurance has grown enormously during the present century. The amount of life insurance now in force in the United States is more than $9,000,000,000. Assessment or Co-operative Insurance has had an enormous development within recent years.

B. *Attributively:* Pertaining to assurance of lives, more rarely of insurances against fire, as the "Standard Life *Assurance* Company," "Hand in Hand Fire and Life *Assurance* Society."

Assyrian Language: A dead language belonging to the Aramæan, or Northern group of the Syro-Arabian tongues. Its nearest living analogue is the Neo-Syriac. It is only in the present century that it has been recovered. From its richness of grammatical forms, the late Dr. Hincks termed it "The Sanscrit of the Shemitic family of languages." The researches of Sir Henry Rawlinson on the trilingual inscriptions of Behistun proved the language of Babylonia, in the time of Darius, to be essentially the same as the Assyrian of Tiglath Pileser. (*Trans. Bib. Archæol. Soc.*, 1872, vol. i., p. 281.) The Biblical Archæological Society's publications are full of information regarding Old Assyria, its language, and its history; and the general appearance of the characters in which the language is written is familiar, even to the most illiterate frequenter of the British Museum, from the numerous specimens of it covering the Assyrian sculptures in one portion of the building.

(*Max Müller.*)] [STAR.] A genus of plants, the type of the order Asteraceæ, or Compositæ. It is so called because the expanded flowers resemble stars. There is but one British species, the *A. tripolium*, Sea Starwort, or Michaelmas Daisy. It is common in salt marshes. The American species are numerous.

¶ The popular name *Aster* is applied to some species not of this genus. Thus the China Aster is *Callistephus chinensis*, and the Cape Aster *Agathæa amelloides.*

ăs-tĕr-ā'-çē-æ, *s.* [From the typical genus *aster* (q.v.).]

Botany:

* 1. *Formerly:* An order, the fourth of five arranged under the alliance Compositæ, or Asterales, the others being Calyceraceæ, Mutisiaceæ, Cichoraceæ, Asteraceæ, and Cynaraceæ. These, excluding Cynaraceæ, constitute the Compositæ proper. The term Asteraceæ in this sense is called also Corymbiferæ (*Lindley: Nat. Syst. Bot.*, 2nd ed., 1836), and comprehends the larger portion of the modern Tubulifloræ.

2. *Now:* A vast order, comprising the whole of the Compositæ proper. [See No. 1.] It is placed by Lindley, in his *Vegetable Kingdom* (1846), as the last order of his Campanales, or Campanal Alliance. The English equivalent term for it is *Compositæ.* It includes plants like the daisy, the thistle, the dandelion, and others, possessing what, to a superficial observer, appears like a calyx, but is in reality an involucre, surrounding a receptacle on which are situated not, as might as first sight appear, numerous petals, but many florets. Their calyxes very frequently take the form of pappus; the corollas are tubular, ligulate, or both; the stamina, four or five, syngenesious, that is, united by the anthers into a tube; their style simple; and the ovaries single, one-celled, with a solitary erect ovule. In 1846, Lindley estimated the known species at 9,000, placed in 1,005 genera. They are believed to constitute about one-tenth of the whole vegetable kingdom. They are everywhere diffused, but in different proportions in different countries; thus they constitute one-seventh of the flowering plants of France, and half those of tropical America. The order is divided into three sub-orders: I. Tubulifloræ; II. Labiatifloræ; and III. Ligulifloræ. All are bitter. For more specific information regarding their qualities, see the sub-orders and some of the genera.

1. *Astron.:* Any single individual of a great group of minute planets placed together between Mars and Jupiter. Prof. Titius, of Wittenberg, having drawn attention in 1772 to the fact that, measuring from Mercury, each planet, with the exception of Jupiter, has an orbit just about double that nearest to it on the side of the sun, Prof. Bode, of Berlin, drew the natural inference that the one exception to the rule would probably be removed by the discovery of a planet less remote from the sun than Jupiter, and more distant than Mars. A society was formed in 1800 for the special purpose of exploring the zodiac with the hope of discovering the supposed planet, but its efforts were not crowned with success. On the first day of the nineteenth century (Jan. 1, 1801) a planetary body, afterwards called *Ceres*, was found by Piazzi (who did not belong to the society) in the part of the solar system theoretically indicated; it was, however, far more diminutive in size than had been expected. Within the next six years three more asteroids (Pallas, Juno, and Vesta) were found in proximity to Ceres, and the suspicion arose that a goodly sized planet had either been blown to pieces by internal forces of an explosive character, or splintered in a collision with some other heavenly body. Sir D. Brewster boldly affirms this in his edition of "Ferguson's Astronomy," while Sir J. Herschel at one time ridiculed the idea. It was reasoned that if such a catastrophe had taken place, many more than four fragments of the shattered planet would probably exist; but the search having been considered futile, it was abandoned in 1816. It was subsequently resumed by M. Hencke, and from 1845 to July, 1879, no fewer than 200 have been met with. All are of minute size, and some angular in place of spherical. According to Mr. Daniel Kirkwood, an American astronomer, they would collectively make a planet only a little larger than Mars.

The term *asteroid*, applied to these small bodies, is now becoming obsolete, the appellation *minor planets* taking its place. *Planetoids* is another name. They are sometimes also called *extra-zodiacal planets*, from their orbits stretching outside the zodiac, which is not the case with those of the normal type. Authorities differ respecting some minute points in the list of asteroids. [PLANET, SOLAR-SYSTEM.]

Among those who have been particularly successful in the search for asteroids may be named the astronomers: Hind, who discovered ten in the years 1847–54; De Gasparis, whose discoveries reached nine, between 1849 and 1865; Goldschmidt, whose researches between 1852 and 1861 added fifteen to the list; and Luther, who discovered nineteen, in the years 1852–1873. Still more successful in their planetary researches have been Peters, of Hamilton College, United States, who, since 1861, has discovered forty-eight; and Palisa, of Vienna, whose first find was in 1872, and whose total discoveries number more than seventy, five of which were found in a single week. The number annually discovered has varied from four or five to seventeen, which number was found in 1875, while during the last twenty years 236 asteroids have been added to the preceding list. In fact, as the number of observers increased, the power of telescopes developed, and the charting of the stars became more full and exact, it grew more and more difficult for an interloper in the celestial spaces to escape detection, while those of a minuteness that would have made them quite imperceptible in former years, yielded the secret of their existence to the increasingly powerful telescopes that were directed towards them, and the drier and clearer atmospheres in which the newer observatories were erected.

What we have so far said is, however, in a measure ancient history as regards the search for asteroids. It applies only to the years preceding 1892. In that and the subsequent years the search for these planetary bodies has been conducted on a new method, of a far more effective character, and new examples are being added to the planetary chart with a remarkable rapidity; an annoying one, indeed, to astronomers, who are beginning to find the crowd of small bodies thus gliding through the starry spaces, and needing to be recognised and named, something of a burden. The naming of them, indeed, has been no small task. The larger planets having been named after the principal mythological gods, with a place reserved among them for a single goddess, the first four and largest of the asteroids were named after the remaining goddesses of high estate. When, later, smaller asteroids began to be added in rapid numbers to the list, they were given the names of the minor goddesses, the nymphs and other deific beings, the Scandinavian mythology supplying a few names to the list. At a later date the "embarrassment of riches" required that names should be taken from other sources than mythology, and the women of history, literature and legend were drawn upon, such titles as Virginia, Sappho, Antiope, Hecuba, Cassandra, Hermione, and various others from ancient times being applied, while more modern times furnished the titles of Brunhilda, Hilda, Bertha, Eva, Ophelia, Maria, and others of the same general character. More recently the method of numbering has been adopted, the available names threatening to become exhausted. This, however, is a matter of curious interest only; the new method by which asteroids are discovered is of much more moment, and calls for a brief description. The system employed is that of photography, a method which is being applied to the secrets of the heavens generally, with a variety of unexpected and important results. Previous to 1892 the searcher after asteroids was obliged to prosecute his search by a slow and laborious process. He was first obliged to make a careful and accurate chart of all the stars visible within certain fixed localities of the heavens, inserting in his map, in their correct places, all the stars visible in the field of his telescope. This done, he gave himself to a careful re-examination of those spaces, as they come one by one opposite the sun, and took their place in the midnight skies, observing them minutely, and watching to see if any star appeared not already on his chart. If such a star were seen it might possibly be a variable star, but was far more likely to be a planet. To settle this question a few hours' observation alone was needed. If a star, it would remain fixed in relative place; if a planet, it would move, slightly changing its place among the stars. Once shown to have a motion of its own, a few days' observation would serve to determine its orbit, and decide whether it was a new planetoid or a re-discovery of one of the older ones, since some of the latter have escaped from observation and have been "adrift" for many years, the original determination of the elements of their orbits not having been accurate.

This tedious process of star-charting, and slow comparison, star by star, of chart and sky, are no longer necessary. The photographic camera does the work far more surely and satisfactorily, and also serves to trace asteroids of a size below the level of telescopic reach. At present the asteroid hunter does his work with a specially constructed lens of from six to eight inches in diameter, mounted like an equatorial telescope, and so adjusted and arranged that it can be made to follow, hour after hour, the diurnal motion of the stars. By this instrument a photograph can be taken of a field of the heavens several hundred times as great in area as can be commanded by the field of view of an ordinary telescope. Several hours are needed for the process, the light of the stars being so faint that it takes hours to impress itself upon the sensitive film. But this exposure for hours is necessary for the discovery of an asteroid, since it gives time for the motion of the latter to declare itself. If all goes well, each of the thousands of stars in the field of the instrument will be impressed upon the photographic plate as a distinct round dot, but if there be a planet among them it will be indicated by a streak or line, due to its movement, and the length and direction of the line will indicate how the body is moving. In some instances two or three such asteroids have been detected on a single plate. This new method of research has proved highly effective. In 1893 no less than forty such discoveries were made. Some of these had been seen before, and some are doubtful, but twenty-one of them have been added definitely to our system, and received their appropriate numbers. It is to be feared that the photographic plate may eventually add several thousands to the number now known, and that they may come so fast and numerously as to be unwelcome additions to our family of planets.

The largest of the asteroids is believed to be not over 450 miles in diameter. The smallest—to be hereafter discovered—may be but a very few miles. The whole body of them cannot contain more than one-fourth the mass of the earth. Their orbits differ greatly, some of them being of great eccentricity and inclination to the ecliptic, others of small, while their distances from the sun vary similarly, so that their orbits are intricately interlaced and, if viewed perpendicularly, would form a kind of net-work. Of those traced up to 1891, Medusa (No. 149) has the shortest period of revolution, 1137.69 days; and Hilda (No. 153) the longest, 2869.92 days. The latter is nearly twice as far from the sun as the former. Polyhymnia's orbit has the greatest eccentricity, amounting to 0.33998; Lomia's the least, 0.2176. The nearest approach to the sun is made by Phocea, its perihelion distance being 1.787 the earth's mean distance. Freia recedes the farthest, its aphelion distance being 4.002. Massalia's orbit makes the smallest angle with the ecliptic of any planet known, it being only 41′ 7″; while the inclination of the orbit of Pallas reaches the high angle of 34° 42′ 41″.

ăs-tĕr-ŏ-lĕp′-ĭs, *s.* [Gr. ἀστήρ (*astēr*) = a star, and λεπίς *lepis*) = a scale, from λέπω (*lepō*) = to strip off a rind, to peel.] A genus of ganoid fishes named on account of the star-like marking of what were at first supposed to be scales, but which were afterwards found to be the dermal plates of the head. A bone of a species belonging to this genus, found at Stromness, the capital of Orkney, suggested to Hugh Miller the writing of his beautiful volume entitled *Footprints of the Creator; or, the Asterolepis of Stromness.* It was an elaborate argument against the development hypothesis. According to that hypothesis, the first species of any class appearing on the scene should be low in organisation, and probably small in size. Mr. Miller showed that the Asterolepis was large in size and high in organisation, and yet it was at that time believed to be the oldest fossil vertebrate found in Scotland. His argument was subsequently weakened by the discovery that the Stromness rocks were less ancient than the Forfarshire beds, containing Cephalaspis and other fish genera subsequently discovered, mostly of small size, though not of low organisation.

All are fossil, and belong to the Carboniferous period. Their name was given on account of the starry appearance of the verticillate foliage. Their stems were articulated and branched, and it is now known that the fossils termed Volkmannia constituted their fructification.

2. *Specially:* Asthma, or spasmodic asthma, is "a difficulty of breathing, recurring in paroxysms, after intervals of comparatively good health, and usually unaccompanied by fever." It is most common in persons possessing the nervous temperament. After some precursory symptoms, it commences, often at night, with a paroxysm in which there is a great tightness and constriction of the chest. The patient breathes with a wheezing sound, and flings open the door or throws up the window in the effort to obtain more air. After a time the paroxysm passes away. Other fits of it probably succeed on subsequent days, but by no means with the regularity of intermittent fever. It is produced by a morbid contraction of the bronchial muscles. There are two leading varieties of the disease, a nervous and a catarrhal, the former of pure sympathetic and symptomatic forms, and the latter latent, humeral, and mucous chronic sub-varieties, besides an acute congestive, and an acute catarrhal form.

1. *Gen.:* Any star-stone, *i.e.,* stone of a radiate structure or superficially radiated, whether a mineral or a fossil organism, the necessity of precise identifications in such matters never having been popularly understood. Hence various radiated minerals, also joints of fossil encrinites, and anything similar, have by one unscientific person or other been designated as *astroites* or *star-stones.*

"*Astroites* or star-stones . . ."—*Brome: Travels* (1700), p. 12. (*Halliwell: Cont. to Lexic.*)

"In the arable grounds towards Barton, lying on a bed of stone, has been found a species of the *astroite,* or starry-stone, very beautiful, deeply intagliated or engraven like a seal."—*Warton: Hist. of Kiddington,* p. 25.

ăs-trŏ-lābe, * **ăs'-trў-lābe,** * **ăs'-trŏ-byre,** *s.* [In Dan., Dut., & Ger. *astrolabium;* Fr. *astrolabe;* Prov. *astrolabi;* Sp., Port., & Ital. *astrolabio;* Low Lat. *astrolabium;* Gr. & Ital. *astrolabio;* Low Lat. *astrolabium;* Gr. ἀστρολάβος (*astrolabos*), ἀστρολαβικόν (*astrolabikon*), from ἄστρον (*astron*) = a star, and λαβεῖν (*labein*), 2 aor. inf. of λαμβάνω (*lambanō*) = to take.] In its etymological sense, any instrument for taking the altitude of a star or other heavenly body, a definition which would include not merely the astrolabe properly so called, but also the sextant, the quadrant, the equatorial, the altitude and azimuth circle, the theodolite, or any similar instrument. But, practically, the word is limited to the three following significations:—

1. A planisphere, a stereographic projection of the sphere upon the plane of one of its great circles. This may be either the plane of the equator, in which case the eye is supposed to be at the pole; or the plane of the meridian, in which case the eye is considered to be at the point of intersection of the equinoctial and the horizon.

ASTROLABE.

2. An armillary sphere or any similar instrument. [ARMILLARY.]

This type of astrolabe was in use among astronomers at least from the early part of the second century A.D., if not even from the second or third century B.C.

"His *astrylabe,* longyng for his art."
Chaucer: C. T., 3,209.

"Liv'd Tycho now, struck with this ray, which shone
More bright i' the morn than others beam at noon,
He'd take his *astrolabe,* and seek out here
What new star 'twas did gild our hemisphere."
Dryden: Death of Lord Hastings, v. 45.

¶ The former use of the word was common in the sixteenth and seventeenth centuries. Such an astrolabe as that first described was the badge of an astrologer.

"She sente for him, and he came;
With him his *astrolabe* he name,
With pointe and circles merveilous,
Which was of fine gold precious."
Gower: Conf. Am., bk. vi.

¶ The forms *astyllabyre* and *astyrlaby* are in *Prompt. Parv.*

"... for we see spheres, globes, *astrolabes*, maps, and the like, have been provided as appurtenances to astronomy and cosmography, as well as books."—*Bacon: Adv. of Learn.*, bk. ii.

3. A graduated circle, with sights attached, in use early in the eighteenth century for taking the altitude of the heavenly bodies at sea. It was ultimately superseded by Hadley's quadrant, introduced to public notice about 1730. (*Penny Cyclopædia.*)

***ăs'-trō-lŏg, *ăs'-trō-lŏgue,** *s.* [Fr. *astrologue*, from Lat. *astrologus*, from αστρολόγος (*astrologos*) = an astronomer: ἄστρον (*astron*) = a star, and λέγω (*legō*) = to tell, to speak of.] As astronomer.

Till ony *astrolog* to say
This pall fall heir and on this day."
Barbour: Bruce, iv. 707.

ȧs-trŏl'-ō-ġĕr, *ȧs-trŏl'-ō-ġēre, *s.* [Eng. *astrolog(y)*; *-er.*] [ASTROLOGY.]

***1.** *Originally:* An astronomer.

"A worthy *astrologer*, by perspective glasses, hath found in the stars many things unknown to the ancients."—*Raleigh.*

¶ As most, if not all, the ancient astronomers believed that the heavenly bodies have an influence upon human destinies; and any one who predicted fortunes from the position of the stars, required to study their movements, no need was at first felt for drawing a distinction between an *astronomer* and an *astrologer* in the modern sense of these terms.

2. *Subsequently and now:* An astrologer, as contradistinguished from an astronomer. A man of unscientific mind who studies the heavenly bodies, not to ascertain the laws which affect their existence and movements, but in the vain hope of forecasting the future destiny of himself or others.

"This made the *astrologers* so idle as to judge of a man's nature and destiny, by the constellation of the moment of his nativity or conception."—*Bacon: Colours of Good and Evil*, ch. x.

". . . the *astrologers*, the star-gazers, and monthly prognosticators, . . . —*Isa.* xlvii. 13.

***ăs-trō-lō'-ġĭ-ȧn,** *s.* [Eng. *astrolog(y)*; *-ian.* In Prov. *astrologian.*] The same as ASTROLOGER (q.v.).

"The twelve houses of heaven, in the form which *astrologians* use."—*Camden.*

". . . an *astrologian*
That in his works said such a day o' the month
Should be the day of doom. . . ."
Webster: Duchess of Malfi, iv. 2.

ȧs-trŏl'-ō-ġĭze, *v.i.* [Eng. *astrolog(y)*; *-ize.* In Gr. ἀστρολογέω (*astrologeō*) = to study or practise astronomy; ἄστρα (*astra*) = the stars, and λόγος (*logos*) = discourse.] To study or practise astrology. (*Johnson.*)

ăs'-trō-lōgue, *s.* [ASTROLOGE.]

ȧs-trŏl'-ō-ġў, *ȧs-trŏl'-ō-ġĭe, *s.* [In Ger. & Fr. *astrologie*; Dan. & Sw. *astrologi*; Sp., Port., Ital., & Lat. *astrologia* = (1) a knowledge of the stars, astronomy, (2) astrology; Gr. ἀστρολογία (*astrologia*) = astronomy; from ἄστρον (*astron*), generally used of stars in the plural, ἀστήρ (*astēr*) = a single star, λόγος (*logos*) = discourse, also reason. A discourse concerning the stars, or the reason of the stars.]

1. *Originally:* The word *astrology*, as yet unspecialized, included both the true science of astronomy and the pseudo science defined under No. 2. [See etymology.]

2. *Now:* The word having become specialized, signifies the pseudo science which pretends to foretell future events by studying the position of the stars, and ascertaining their alleged influence upon human destiny. *Natural Astrology* professes to predict changes in the weather from studying the stars [ASTRO-METEOROLOGY], and *Judicial* or *Judiciary Astrology* to foretell events bearing on the destiny of individual human beings or the race of mankind generally.

¶ In the infancy of the world, when the stars were assumed to be, as they seemed, sparkles of light, whose diminutiveness so markedly contrasted with the hugeness of the earth, it was a perfectly legitimate conjecture or hypothesis that one main function which the shining specks served in the economy of nature might be to influence human destinies. Hence the Chinese, the Egyptians, the Chaldæans, the Romans, and most other ancient nations, with the honorable exception of the Greeks, became implicit believers in astrology. It was partly the cause and partly the effect of the prevalent worship of the heavenly bodies. The "stargazers," sarcastically referred to by Isaiah (xlvii. 13), were evidently astrologers: so also were what are called in the margin "viewers of the heavens;" but the Heb. word rendered "astrologers" in Dan. i. 20; ii. 2, 27; iv. 7; v. 7, is a much vaguer one, meaning those who practise incantations, without indicating what the character of these incantations may be. The later Jews, the Arabs, with other Mohammedan races, and the Christians in mediæval Europe, were all great cultivators of astrology. The ordinary method of procedure in the Middle Ages was to divide a globe or a planisphere into twelve portions by circles running from pole to pole, like those which now mark meridians of longitude. Each of the twelve spaces or intervals between these circles was called a "house" of heaven. The sun, the moon, and the stars all pass once in twenty-four hours through the portion of the heavens represented by the twelve "houses;" nowhere, however, except at the equator, are the same stars uniformly together in the same house. Every house has one of the heavenly bodies ruling over it as its lord. The houses symbolize different advantages or disadvantages. The first is the house of life; the second, of riches; the third, of brethren; the fourth, of parents; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death; the ninth, of religion; the tenth, of dignities; the eleventh, of friends; and the twelfth of enemies. The houses vary in strength, the first one, that containing the part of the heavens about to rise, being the most powerful of all: it is called the *ascendant* [ASCENDANT]; whilst the point of the ecliptic just rising is termed the *horoscope*. The important matter was to ascertain what house and star was in the ascendant at the moment of a person's birth, from which it was deemed possible to augur his fortune. It followed that all people born in the same part of the world at the same time ought to have had the same future, an allegation which experience decisively contradicted. Even apart from this, astrological predictions of all kinds had a fatal tendency to pass away without being fulfilled; and when, finally, it was discovered that the tiny-looking stars were suns like that irradiating our heavens, and the earth not the centre of the universe, but only a planet revolving round another body, and itself much exceeded in size by several of its compeers, every scientific mind in Europe felt itself unable any longer to believe in astrology, which has been in an increasingly languishing state since the middle of the seventeenth century. It still flourishes in Asia and Africa. Thus when a Brahman boy comes into the world means are at once taken to construct his "horoscope," indicating what his future destiny is to be. But in America, at this advanced period of the nineteenth century, no one can profess to believe in astrology without exciting the gravest doubt regarding his intellect, his knowledge, or his good faith. It is legal to publish a work disfigured with astrological vaticinations; but the moment one accepts payment for telling, by the help of the stars, the "fortune" of an individual, he or she becomes liable to arrest, in England, as a "rogue and a vagabond." No belief, extensively held and long prevalent, ever passes away without leaving traces in language, and *ascendant, ascendency, disaster, disastrous, evil-starred, influence, mercurial, jovial, saturnine*, &c., are all astrological terms.

"The Marquess of Huntly was in the king's interests, but would not join with him, though his sons did. *Astrology* ruined him; he believed the stars, and they deceived him."—*Burnet: Hist. of his own Time*, bk. i. (*Richardson.*)

ăs-trō-mē-tĕ-ŏr-ŏl'-ō-ġў, *s.* [Gr. ἄστρον (*astron*) = a star, and Eng. *meteorology* (q.v.).] The investigation of the influence exerted by the sun, moon, and stars upon the weather. The sun, of course, exerts transcendent influence. The notion that changes of the weather take place at changes of the moon is not borne out by impartial inquiry. The stars seem absolutely void of perceptible effect on the weather.

ăs-trō-mĕ-tĕ-or'-ō-scōpe, *s.* [Gr. ἄστρον (*astron*) = a star, and Eng. *meteoroscope* (q.v.).] An apparatus invented by Mr. Pichler for demonstrating, by means of the optical lantern, the effects of persistence of vision.

ȧs-trŏm'-ĕ-tĕr, *s.* [Gr. ἄστρον (*astron*) = a star, and μέτρον (*metron*) = a measure.] An instrument invented by Sir John Herschel for measuring the apparent relative magnitudes of the stars.

ȧs-trŏm'-ĕt-rў, *s.* [ASTROMETER.] The measurement and the numerical expression of the apparent magnitudes of the fixed stars.

***ȧs-trŏm'-ŷ-ĕn,** *s.* [Apparently abbreviated from O. Eng. *astronomien* to make it fit more easily into a line of poetry.] An astronomer, an astrologer, or both in one person.

"Of gold he made a table,
Al ful of steorren, saun fable,
And thought to seyn, amonges men,
That he is an *astrumpen*."
Alisaunder, l. 136. (*Boucher.*)

ȧs-trŏn'-ŏm-ĕr, *ȧs-trŏn'-ŏm-ēre, *ȧs-trŏn'-ŏm-yĕr, *s.* [Eng. *astronom(y)*; suffix *-er.* In Sw. *astronom*; Fr. *astronome*; Sp., Port., & Ital. *astronomo*; Lat. *astronomus*; Gr. ἀστρονόμος (*astronomos*), as *adj.* = classing the stars, as *substan.* = an astronomer; ἄστρον (*astron*) = a star, ἄστρα (*astra*) (pl.) = stars, and νέμω (*nemō*) = to distribute, . . . to pasture (a flock). Hence an astronomer is a classifier of the stars, or, according to Herschel, a "shepherd of the stars."] [ASTRONOMY.]

Essential signification: One who studies the stars, the word giving no indication as to his motive in so doing. During ancient and mediæval times the keenest spur to the exploration of the heavens was furnished by the belief, then all but universally entertained, that the stars influenced human destinies; hence *astronomer* signified—

***1.** *Originally:* In the main an astrologer; one who studied the stars, partly, no doubt, from scientific curiosity, but chiefly because he believed they influenced human destinies.

"If *astronomers* say true, every man at his birth by his constellation hath divers things and desires appointed him."—*Pilkington: Exposition upon the Prophet Aggeus*, ch. i. (See *Trench: Select Glossary*, p. 12.)

"But what was ominous, that very morn
The sun was entered into Capricorn,
Which, by this bad *astronomer's* account,
That week the Virgin Balance should remount."
Dryden: Hind and Panther.

2. *Subsequently:* As study of the heavens advanced, the more gifted minds discovered the fallacy of the old notion that the stars influenced human destinies, whilst the less talented firmly adhered to the popular delusion on the subject. It consequently became needful to distinguish the two classes of men. The word *astronomer* was therefore reserved for any really scientific student of the stars, whilst the term *astrologer* was abandoned to the credulous, if not even insincere, star-gazer. Convenience dictated this arrangement: if etymology were followed, an astrologer would be regarded as the equal, if not the superior, of an astronomer. [ASTROLOGER.]

"It [Encke's comet] was predicted and generally observed in 1825, and so anxious were *astronomers* to discover it, that two new comets were found in looking for it."—*Airy: Report on Astronomy. Brit. Assoc. Rep.*, vol. i., 2nd ed. (1832), p. 183.

Astronomer Royal: The appellation given to the eminent astronomer entrusted by the

British Government with the care of the Greenwich Observatory, and who is expected to turn to the best account the splendid instruments erected there for the survey of the heavens. There are also Astronomers Royal for Scotland and Ireland.

ăs-trō-nŏm´-ic, *ăs-trō-nŏm´-ick, ăs-trō-nŏm´-ĭc-al, *a.* [In Fr. *astronomique*; Sp., Port., & Ital. *astronomico*; Lat. *astronomicus*; all from Gr. ἀστρονομικός (*astronomikos*).] Pertaining or relating to astronomy, or to the methods in use among astronomers.

"The starry heavens, as you know, had for Immanuel Kant a value beyond their *astronomical* one."—*Tyndall: Prag. of Science*, 3rd ed., v. 104.

astronomical instruments. Instruments used for observing the heavenly bodies. The following list includes some which are now superseded, but the great majority are still in use:—Armil, armillary sphere, artificial horizon, astrolabe, astrometer, astroscope, azimuth circle, azimuth dial, back-staff, chronometer, clock, collimator, comet-seeker, compass, cosmolabe, diplei[illegible], dip sector, [illegible], equatorial, [illegible], heliometer, meridian circle, micrometer, mural circle, orbit-sweeper, orrery, pendulum, planetarium, quadrant, reflecting circle, refraction circle, sextant, spectroscope, telescope, tellurian, transit instrument, zenith sector, zenith tube.

astronomical measurements. The measurement of the arc of the heavens intercepted between two points, as between a star at a certain moment and the horizon. Or a measurement of the exact time of some event, say a transit. This is done by means of a clock, or, more generally, a chronometer. (*Herschel: Astron.*, § 150.)

astronomical observations. Observations of the heavenly bodies made to further the science of astronomy. (*Ibid.*, § 136.)

astronomical year. A year, the precise length of which is determined by astronomical observations. It embraces both the tropical and the sidereal years. It is opposed to the civil year, being that which each nation has adopted for itself. [Year.]

* 1. *Originally:* The pseudo science which studied the movements of the stars, with the view of obtaining information (which they were not fitted to give) regarding the destiny of individuals or bodies of men; astrology. [Astrology. See also Astronomer.]

"And hem lerede, witter like

Story of Gen. and Exod. (ed. Morris), 731-2.

"Not from the stars do I my judgment pluck,
And yet methinks I have *astronomy*."
Shaksp.: Sonnets, 14.

2. *Subsequently and now:* The sublime science which treats of the distances, magnitudes, masses, composition, motions, and all that is discoverable regarding the heavenly bodies, meaning the sun, the earth, the moon, the planets, the fixed stars, the comets, the meteorites, the nebulæ, and all other material bodies really or apparently moving in infinite space. It is founded on careful and oft-repeated observations, made chiefly with elaborately-constructed instruments [Astronomical Instruments]; these observations being next made the basis of reasoning, founded, wherever it is practicable, as it generally is, on mathematical demonstration. Astronomy may be variously divided. A simple distinction is sometimes made into *geography*, which treats of the earth, and *uranography*, the subject of which is the "heavens." Sometimes the branch of science which describes the celestial bodies as they are is called *Descriptive Astronomy*. When the specific subject treated is the "fixed" stars, it becomes *Sidereal Astronomy*. The sciences now mentioned have sought rather to record than to explain phenomena; but what is called *Physical Astronomy* proposes to itself the high aim of accounting for the facts observed. Its chief ally in this arduous task is mathematics, with which every astronomer worthy of the name requires to be very familiar.

¶ The vault of heaven, being visible in all its glory alternately by day and night in every portion of the world, absolute ignorance regarding celestial phenomena cannot have existed in any place or at any time. The people belonging to some nations were, however, more observant in this respect than others, and claims to early proficiency in astronomy, in some cases leading to vehement controversy, have been preferred in favour of the Chinese, the Chaldæans, the Egyptians, and the Hindoos. In these and other countries, in early times, the stars were not so much studied as worshipped, there being strong temptation, even in the most pious minds, to this form of religious error (Job xxxi. 26—28). Hipparchus of Bithynia and Rhodes (?), who flourished from B.C. 160 to 125, catalogued the stars visible above the horizon, noting down 1,080. Among his numerous discoveries may be reckoned the precession of the equinoxes, trigonometry, and apparently the stereographic projection of the sphere. The next very great name was that of Ptolemy, the geographer and astronomer of Alexandria, A.D. 130—150, who discovered the lunar evection, refraction, &c. [Evection, Refraction.] He was also the author of the Ptolemaic system, with its *primum mobile*, its eccentrics, and its epicycles.

"Oh, how unlike the complex works of man
Heaven's easy, artless, unincumber'd plan."
Cowper: Truth.

The Arabs translated a work of Ptolemy's called Μέγιστη (*Megistè*) into their own language, and prefixing to its name their article *al* = the, transformed it into *Almagest*. The Christians during the "dark ages" deriving their knowledge of astronomy from the Arabs rather than from a study of the heavens, received from their instructors the Ptolemaic system and the Almagest, which did not lose credit in Western Europe till the seventeenth century. [Almagest, Ptolemaic.] In 1472 or 1473 was born Copernicus, who in 1543, [illegible] before his death, published his great work, *On the Revolutions of the Heavenly Bodies*, containing more than thirteen years before it [illegible] the Copernican system. Copernicanism, which is now, and improved, is now received as established truth, being supported by an amount of evidence of which Copernicus had no conception. The next very great name is that of Tycho Brahe, a Dane, [illegible] born, [illegible] Swedish monarchy. He was born on the 14th of December, 1546, and died in 1601. Tycho [illegible] the Copernican system, [illegible] partly from Copernicus and partly from Ptolemy. Tycho Brahe [illegible] accurate observations as gave a great impulse to astronomy, and prepared the way for further discoveries, in addition to those which he had himself made. Two great names now come [illegible] upon the scene, those of Kepler and [illegible]. The former was a pupil of Tycho. He was [illegible] by the discovery of the three laws with [illegible] the first and second [illegible] which [illegible] Kepler's Laws. Galileo [illegible] the isochronism of the pendulum (Pendulum); having constructed a telescope, he discovered in 1610 the satellites of Jupiter, the phases of Venus, the mountains of the moon, with other new truths. In 1642, the year in which Galileo died, Sir Isaac Newton was born, and in 1687 he published his immortal *Principia*, in which the law of gravitation was announced, thus constituting an epoch in the history of science which probably will never be paralleled at any future time.

"Nature and Nature's laws lay hid in night:
God said, 'Let Newton be,' and all was light."
Pope.

The year that Newton died (1727) was the one in which the discovery was made by Bradley of the aberration of light, which irrefragably proved the motion of the earth, and gave the death-blow to the Ptolemaic and Tychonic systems, both of which were founded on the hypothesis that it was stationary. As we approach [illegible] times the discoveries become far too numerous to be chronicled here; but room must be found to mention the Herschel family—the first of the name, Sir William Herschel, who was born in 1738, and died in [illegible], among other great discoveries, added nine new members of the solar system, one of them, the planet Uranus, to the eighteen previously known. The work on astronomy so often quoted in these pages was penned by his son, Sir John Herschel, also a great discoverer; and the third generation of the family are now at work. Many discoveries will be found recorded under other articles. [Asteroid, Comet, Constellation, Gravitation, Planet, Solar System, Star, &c.]

"In *astronomy*, for instance, the superior departments of theory are completely disjoined from the routine of practical observation."—*Herschel: Study of Nat. Phil.* (1831), § 126.

B. *As substantive:* A follower of Athanasius, or one holding his views with respect to the Trinity.

"Upon the revival of the Arian controversy in Gaul, under the influence of the Burgundian kings, it was obvious to call one side *Athanasians*, and the other side Arians; and so also to name the orthodox faith the Athanasian faith, as the other Arian."—*Waterland: Hist. of the Athanasian Creed.*

Athanasian Creed. The creed which the framers of the English Liturgy, with proper critical acumen, designate as "this Confession of our Christian Faith commonly called the Creed of Saint Athanasius," thus avoiding any expression of belief as to its real authorship. Though correctly expressing the doctrine of that Christian father, it seems not to have been penned till after his time. Dr. Waterland ascribed it to Hilary, Bishop of Arles from A.D. 430 to 449. It was about the beginning of the eighth century that it commenced to be read in liturgic worship. The English Prayer-book enjoins that it be used in the churches on the principal festivals, when it is to take the place of the Apostles' Creed, and to be sung or said "by the minister and people standing." The Greek Church has modified the article relating to the "Procession" of the Holy Ghost.

The theological treatises, regarded as fifty-two in number, called *Upanishads*, are appended to the Atharvan Veda.

āthe, āith, *s.* [OATH.] (*Scotch.*)

ā'-thĕ-ĭşm, * ā'-thĕ-ĭşme, *s.* [In Ger. *atheism, atheismus;* Fr. *athéisme;* Sp. & Ital. *ateismo;* Port. *atheismo;* from Gr. ἀ, priv., and θεός (*theos*) = God.] Literally, disbelief in a God, if such an attainment is possible; or, more loosely, doubt of the existence of a God; practically, a denial that anything can be known about the supernatural, supposing it to exist. [AGNOSTICISM.]

"It is true that a little philosophy inclineth man's mind to *atheism*, but depth in philosophy bringeth men's minds about to religion."—*Bacon: Essays, Civ. & Mor.*, ch. XVI.

Hist. & Philos.: Among the Greeks atheism consisted in a denial or non-recognition of the gods of the State. [PYRRHONISM, SCEPTICS, SOPHISTS.] Socrates was put to death for asserting the superiority of the Divine Wisdom (φρόνησις) to the other gods, as the ruler and disposer of the universe, thus contradicting Greek mythology, which assigned that office to Zeus. In Latin times atheism still continued to be a negation, with no pretension to rank as a system. Voltaire speaks of it as having destroyed the republic, and says that it was factious in the time of Sulla and of Cæsar, and slavish under Augustus and Tiberius. It was closely akin to that cultured unbelief which extensively prevailed at the Roman Curia during the early part of the Renascence. Macaulay (*Ranke's History of the Popes*) is very severe on the "men who, with the Latinity of the Augustan age, acquired its atheistical and scoffing spirit." The atheism of the eighteenth century was a protest against the persecution of fanaticism; and, like its predecessors, put forward little or nothing to replace the system it attempted to destroy. The atheism of the present century may be taken to include every philosophic system which rejects the notion of a personal Creator: in this sense it ranks as a genus, of which Atomism, Pantheism, Positivism, &c., are species. Strictly, it is the doctrine that sees in matter the sole principle of the universe. Popularly, atheism consists in the denial of a God: this view is probably founded on the mistranslation of Psalm xiv. 1, and liii. 1, which should be, "The fool hath said in his heart, No God *for me*"—*i.e.*, he wilfully rejects God, at the same time knowing that He is.

ā'-thĕ-ĭst, *s.* & *a.* [In Ger. *atheist;* Fr. *athée,* † *athéiste;* Sp. & Ital. *ateista;* Port. *atheista;* Lat. *atheos;* from Gr. ἀ, priv., and θεός (*theos*) = God.]

At-lăn'-tĭs, At-lăn'-tī-cą, *s.* [From Gr. Ἀτλαντίς (*Atlantis*).] An island, said by Plato and others to have once existed in the ocean immediately beyond the Straits of Gades, that is, in what is now called the Atlantic Ocean, a short distance west of the Straits of Gibraltar. Homer, Horace, and some others made two "Atlanticas," distinguished as the *Hesperides* and the *Elysian Fields*, and believed to be the abodes of the blest. The patriotic view, of course, would gladly make these Great Britain and Ireland. Plato states that an easy passage existed from the one Atlantis into other islands, which lay near a continent exceeding in size all Europe and Asia. Some have thought this America. Atlantis is represented as having ultimately sunk beneath the waves, leaving only isolated rocks and shoals in its place. Geologists have discovered that the coast-line of Western Europe did once run farther in the direction of America than now; but its submergence seems to have taken place long before historic times, so that the whole ancient story about Atlantis was probably founded on erroneous information, or arose from a clever guess put forth by a man of lively imagination.

ăt'-lăs-ite, *s.* [Apparently from Ger., &c., *atlas* = . . . satin, named from the satiny or silky character of the mineral. The term corresponds with Ger. *atlaserz* = fibrous malachite.] A mineral believed by Dana to be not sufficiently distinct from Azurite to constitute a quite independent species. He believes that it may be a mixture of about 3½ parts of Azurite with 1 part of Atacamite. It is from Chili.

ăt-mī-dŏm'-ĕt-ĕr, *s.* [From Gr. ἀτμίδος (*atmidos*), genit. of ἀτμίς (*atmis*) = the steam of a fomentation. Cognate with ἀτμός.] [See ATMOMETER.] An instrument still in use, invented by Babington, for measuring the evaporation from water, ice, snow, &c. It consists of two glass or metal bulbs, one of them placed above the other, with which it communicates by a narrow neck. The lower one is weighted with shot or mercury, and the upper has on it a small glass or metal stem, with a scale graduated in grains and half-grains. On the top of all there is a shallow pan. The instrument being immersed in a vessel of water through a circular hole in which the steam rises, distilled water is gradually poured into the pan above, causing it to sink to the point at which the zero of the steam is on a level with the cover of the vessel. As then the water in the pan gradually evaporates, the stem slowly ascends, the amount of evaporation being indicated in grains on the graduated scale. (*Brande.*)

ăt-mŏ-lȳze, *v.t.* [Gr. ăt-mŏ-lȳz'-ĕr, *s.* [Eng. *atmolys(e); -er.*] That which produces atmolysis, the partial separation of gases or vapours of unequal diffusibility.

Tube atmolyser: An instrument for effecting this result. It consists of a tube of unglazed earthenware, about two feet in length, placed within a shorter tube of glass in contact with an air-pump. The air between the two tubes being to a large extent exhausted, the mixed gases are allowed slowly to traverse the earthenware pipe, when much of the lighter one escapes through the pores into the other. (*Fownes.*)

ăt-mŏl'-ȳs-ĭs, *s.* [ATMOLYSE.] The act or operation of separating two gases in combination from each other. (*Fownes.*)

ăt-mŏm'-ĕ-tĕr, *s.* [Gr. ἀτμός (*atmos*) = smoke, steam, vapour; Sansc. *atma* = spirit, soul; and Gr. μέτρον (*metron*) = a measure.] An instrument invented by Sir John Leslie for measuring the quantity of moisture exhaled in a given time from any humid surface. It consists of a very thin ball of porous earthenware, from one to three inches in diameter, having a small neck firmly cemented to a long and rather wide tube of glass, to which is adapted a brass cap with a narrow collar of leather to fit closely. It is filled with distilled or pure water, and its cap screwed tightly. It is then suspended out of doors in a situation where it is exposed freely to the action of the wind, but is sheltered from rain. As the water evaporates from the external surface of the ball, it transudes through its porous substance, and the waste is measured by the corresponding descent of the liquid in the stem. To test the amount of this descent there is a finely-graduated scale. When the water has sunk to the bottom of the stem the latter requires to be filled anew.

1. *Lit.:* The air surrounding our planet, and which, as the etymology implies, is, speaking broadly, a "sphere" (not, of course, a solid, but a hollow one). With strict accuracy, it is a hollow spheroid. Its exact height is unknown. At 2·7 miles above the surface of the earth half its density is gone, and the remainder is again halved for every further rise of 2·7 miles. Some small density would remain at forty-five miles high. At eighty miles this would have all but disappeared. But from sundry observations, made at Rio Janeiro and elsewhere, on the twilight arc, M. Liais infers that the extreme limit of the atmosphere is between 198 and 212 miles. For its weight, see ATMOSPHERIC PRESSURE. In the lower strata of the atmosphere the temperature falls at least a degree for every 352 feet of ascent; hence, even in the tropics, mountains of any considerable elevation are snow-capped. The atmosphere appears to us blue, because, absorbing the red and yellow solar rays, it reflects the blue ones. It revolves with the earth, but being extremely mobile, winds are generated in it, so that it is rarely long at rest. [WIND.] For its composition, see AIR. Evaporation continually at work sends into it quantities of water in a gaseous state; clouds are formed [CLOUDS], and in due time descend in rain. [RAIN, METEOROLOGY.] The atmosphere always contains free electricity, sometimes positive and sometimes negative. There appears to be no atmosphere around the Moon; but the case seems different with the Sun, Venus, Mars, Jupiter, and Saturn.

† **atmospheric air.** The ordinary air belonging to the atmosphere, as contradistinguished from other "airs," the old term for gases. Now that the word *air* has come specifically to mean that in the atmosphere, the expression *atmospheric air* is a tautology, and will probably sink into disuse.

atmospheric or **atmospherical clock.** A machine planned by Sir David Brewster for measuring the mean temperature of the atmosphere.

atmospheric engine. An engine in which the piston was forced down by the pressure of the atmosphere, when the steam, which caused it to rise, was condensed so as to produce a near approach to a vacuum in the cylindrical chamber beneath it. Such was Newcomen's engine, constructed in 1705, and subsequently improved by Smeaton, Brindley, and others, till superseded by Watt's single-acting engine, which was a genuine steam-engine. The atmospheric engine was used only for pumping water.

Mech.: A line drawn upon an indicator-card by a pencil worked by the steam of a steam-engine, and designed to register the equilibrium line between steam pressure on the piston and the extent of the vacuum produced on the other. The former is indicated by numbers ascending above the atmospheric line; the latter by numbers descending below it; while itself it stands at zero. [INDICATOR-CARD.]

atmospheric pressure. The pressure exerted by the atmosphere, not merely downwards, but in every direction. It amounts to 14·7 lbs. of weight on each square inch, which is often called in round numbers 15. On a square foot it is = 2,160 lbs., or nearly a ton. It would act upon our bodies with crushing effect were it not that the pressure, operating in all directions, produces an equilibrium. If any gas or liquid press upon a surface with a force of 15 lbs. on a square inch, it is generally described as having a pressure of one atmosphere; if 60 lbs., of two atmospheres; if 120 lbs., of four atmospheres, and so on.

atmospheric railway. A railway in which the propulsive force designed to move the carriages along is that of the atmosphere. The notion of such a method of locomotion seems first to have suggested itself, in the latter part of the seventeenth century, to the French physician, Papin, whose name is for ever associated with the celebrated digester. [DIGESTER.] In 1810 Mr. Medhurst published a work entitled *A New Method of conveying Letters and Goods by Air.* His proposal was to construct a closed tunnel, in which the carriages—the last of them provided with a piston fitting the tunnel—should be propelled by air forced in behind them. Vallance, of Brighton, in 1825, recommended as an improvement on this plan the exhaustion of the air in front. About 1835 Mr. Henry Pinkus, an American gentleman residing in England, patented a scheme for placing the carriages in the open air, but connecting them below with a small tunnel, having a narrow slit above, with ingeniously-constructed apparatus to render the tunnel temporarily air-tight notwithstanding the slit. Not much was done to carry out the patent; and Pinkus's scheme of what he called a Pneumatic Railway was considered as having failed, when, in 1840, Messrs. Clegg and Samuda brought forward a somewhat similar project under the name of the "Atmospheric Railway." An experimental fragment of line laid down near Wormwood Scrubs, on the Great Western line, was successful, as was one designed for actual use from Kingstown to Dalkey, in Ireland, another between London and Croydon, and a third in South Devon; all, however, have been since abandoned. For passengers at least, and to a great extent even for the transmission of letters, the railways of the ordinary type, on which steam is the impelling force, have triumphantly held their own against the innovation of the Atmospheric or Pneumatic Railway, and all that now remains of the latter method of propulsion are the pneumatic dispatch tubes, used in London, and recently introduced in some American cities, for transmitting mail and parcels to short distances. [PNEUMATIC.]

atmospheric tides. Tides which must exist in the atmosphere as they do in the ocean, from the attractions of the moon and the sun.

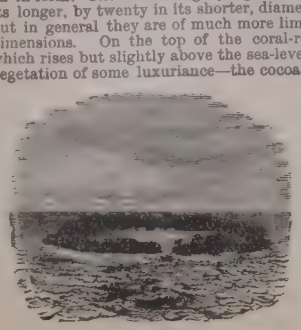
a'-tŏll, *s. & a.* [A Maldive word Anglicised. In Fr. *atollon.*]

A. *As substantive:* The name applied by geologists and others to any one of the lagoon islands or annular coral reefs found in the Pacific and the Indian Oceans, the Red Sea,

and some other parts of the tropics. An atoll is a ring of coral rock, oval rather than circular in form. One reaches eighty-eight miles in its longer, by twenty in its shorter, diameter; but in general they are of much more limited dimensions. On the top of the coral-rock, which rises but slightly above the sea-level, is vegetation of some luxuriance—the cocoa-nut



ATOLL.

being the most conspicuous plant. On the convex circumference of the ring is a beach of white sand, exterior to which is a line of breakers, and a few feet beyond them the unfathomable ocean. The ring of land, which is less than half a mile across, encircles a lagoon of comparatively still water, which, from reflection, is of a bright but pale-green colour. In the view of Mr. Darwin, now almost universally adopted, there was once an island, possibly even containing high land, in the place now occupied by the lagoon. It was surrounded by a "fringing reef" of living coral close to the shore. As, from geological causes, it slowly subsided into the deep and disappeared, the coral animals built up to the surface of the water, and formed the ring of rock constituting the modern island. In the larger atolls there are generally two or three breaks in the ring, affording ship-channels into the lagoon; these mark the spots where fresh water, discharged from the old subsiding land into the sea, prevented the coral animals, which are marine, from locating themselves or building. [CORAL.]

"... hence I have invariably used in this volume the term '*atoll*,' which is the name given to these circular groups of coral islets by their inhabitants in the Indian Ocean, and synonymous with lagoon-island."—*Darwin: Coral Reefs* (1842), p. 2.

"And teach these *atoms*, thou hast made, thy praise?"
Cowper: Glory to God Alone.

II. *Technically:*

1. *Mental Phil.:* A particle of matter so infinitely small that it cannot again be subdivided; the idea of a divided atom—that is, of a division of that which cannot be divided—being self-contradictory. It is a mental conception simply; for the senses cannot take cognizance of anything so minute.

2. *Nat. Phil.:* One of the exceedingly minute ultimate particles of matter, aggregates of an immense number of which, held in their place by molecular forces, constitute all material bodies.

3. *Chem.:* The smallest particle into which an element can be divided. An atom cannot exist in a separate state, but unites with one or more atoms to form a molecule. The atoms of different elements have definite relative weights fixed and invariable for each, the weight of an atom of hydrogen being regarded as unity. [ELEMENT.]

atomic heat.

Chem.: A term introduced by M. Regnault. The atomic heat of the elements in a solid state is nearly a constant quantity, the mean value being 6·4. This number is obtained by multiplying the specific heat of an element by its atomic weight. The atomic heat of an element represents the quantity of heat which must be imparted to or removed from atomic proportions of the several elements, in order to produce equal variations of temperature. (See *Watts' Dict. Chem.*)

atomic or **atomical philosophy.**

Mental and Nat. Phil. The Doctrine of Atoms: A doctrine or hypothesis originally broached by Leucippus, afterwards developed by Democritus, and which underwent further modifications at the hands of Epicurus. It represented atoms as possessed of gravity and motion, and attributed to their union the formation of all things. Democritus is reported to have said that they come together in different order and position like the letters, which, though they are few, yet by being placed in conjunction in different ways produce innumerable words.

atomic theory.

Nat. Phil. & Chem.: A theory first propounded by John Dalton in his *New System of Chemical Philosophy*, published in 1807. He stated that the atoms of each element were incapable of being subdivided, and each had a definite relative weight, compared with that of hydrogen as 1; that the composition of a definite chemical compound is constant; that if two elements, A and B, are capable of uniting with each other in several proportions, the quantities of B which unite with a given quantity of A usually bear a simple relation to one another. If an element A unites with certain other elements B, C, D, then the quantities B, C, D, which combine with A, or simple multiples of them, represent the proportions in which they can unite among themselves. Dalton supposed that one element replaced another atom for atom, but it has since been found that one atom of an element can replace one or more atoms of another element, according to their respective atomicities. [ATOMICITY.]

atomic volume.

Chem.: A term introduced by Graham in lieu of the phrase "specific volume," used by Dr. Kopp. (*Graham's Chemistry.*) It signifies the volume or measure of an equivalent or atomic proportion in different substances. It is obtained by dividing the molecular weight of a compound by its specific gravity. The specific gravity of a compound gas or vapour referred to hydrogen as unity is equal to half its atomic weight; therefore the atomic volumes of compound gases or vapours referred to hydrogen as unity are, with few exceptions, equal to 2. The densities of isomorphous solid compounds are proportional to their molecular weights, that is, they have equal atomic or specific volumes. The differences of specific or atomic volume of organic liquids is often proportional to the differences between the corresponding chemical formulæ. Thus liquids whose formulæ differ by nCH_2 differ in specific or atomic volume by n times 22. (See *Watts' Dict. Chem.*)

atomic weight. (Symbol and abbreviation, At. Wt.)

Chem.: The weight of an atom of an element compared with the weight of an atom of H, which is regarded as unity. Thus the atomic weight of oxygen is 16; that is, an atom of O is sixteen times as heavy as an atom of H. The sum of the atomic weights of a chemical compound is called its molecular weight, and, with a few exceptions, the specific gravities of all bodies, simple and compound, in the gaseous state are equal to half their molecular weights. The specific heats of many of the elements are nearly proportional to their atomic weights. (For atomic weights, see ELEMENT.)

ăt-ŏm-ĭç'-ĭ-tў, *s.* [*Eng. atomic; -ity.*]

Chem.: The combining capacity of an element or radical. It is measured by the number of atoms of H or other monatomic elements with which the element in question can directly combine, or can replace in a substance. When an element does not unite with H its atomicity may be measured by the number of atoms of Cl or some other monatomic element with which it can directly combine, since the atomicity of these elements is equal to that of H, and they may be substituted for it, atom for atom. The atomicity of an element cannot be estimated by the number of diatomic or polyatomic atoms that it can take up, as this number is indefinite. A diatomic element like oxygen may attach itself to another element, or group of elements, by one of its combining bonds, leaving the other free; and to this again another diatomic or polyatomic element may be attached, and so on indefinitely. The atomicity of an element is also called its *quantivalence.*

B. *Technically :*

I. *Scripture :*

1. *Old Test. :* In the authorised version of the Old Testament the word *atonement* occurs not less than fifty-eight times in the text, and once in the margin ; all but five of the places in which it is found being in the Pentateuch. It signifies—

(1) Expiation of sin by means of a typical sacrifice, generally of a victim, offered in faith.

"For the life of the flesh is in the blood : and I have given it to you upon the altar to make an *atonement* for your souls : for it is the blood that maketh an *atonement* for the soul."—*Lev.* xvii. 11.

"And one kid of the goats for a sin-offering, to make an *atonement* for you."—*Numb.* xxix. 5. (See also Lev. i. 4 ; iv. 35 ; x. 17 ; xvi. 10, 33, 34 ; Numb. viii. 21 ; xvi. 46 ; xxv. 13 ; 2 Sam. xxi. 3 ; 2 Chron. xxix. 24, &c.)

(2) The removal, by a sacrificial offering, of ceremonial impurity (Lev. xii. 7, 8). In this sense the term was sometimes used of inanimate things—namely, of the altar (Exod. xxix. 36, 37 ; Lev. xvi. 18) ; of a house infected with the "leprosy" (xiv. 53) ; of the holy place, on account of the sins of the worshippers (xvi. 16) ; of the holy of holies (ver. 33) ; of the tabernacle of the congregation (*ibid.*) ; and of the work of the Temple (Neh. x. 33).

(3) Ransom.

"Then he is gracious unto him, and saith, Deliver him from going down to the pit : I have found a ransom [margin, *atonement*]."—*Job* xxxiii. 24.

(4) In one place *atonement* is used for what was, in its essential features, a thank-offering (Numb. xxxi. 50).

¶ (*a*) *Atonement money :* Money paid for purposes of atonement.

"And thou shalt take the *atonement-money* of the children of Israel."—*Exod.* xxx. 16.

(*b*) The Day of Atonement or the Great Day of Atonement was on the tenth of the seventh month. (For details regarding it, see Lev. xxiii. 26—32 ; xxv. 9.)

2. *New Test. :* In the New Testament the word occurs only once—viz., in Rom. v. 11 : "And not only so, but we also joy in God through our Lord Jesus Christ, by whom we have now received the *atonement*" (in the margin, *reconciliation*). The Greek word is καταλλαγήν (*katallagēn*) = (1) the exchange of one thing for another, as, for instance, money for an article ; (2) a change from enmity to friendship ; reconciliation ; from καταλλάσσω (*katallassō*) = (1) to change money ; (2) to change a person from enmity to friendship ; to reconcile. The marginal rendering is evidently correct. And in 2 Cor. v. 18, 19, the same Greek substantive is twice rendered "reconciliation," and the same Greek verb, also twice, "reconcile." [A., 1.]

II. *Theology :* The sacrificial offering made by Christ in expiation of the sins, according to the Calvinists, of the elect only ; according to the Arminians, of the whole human race.

It is used to signify the cruel deeds perpetrated by the Turks in 1876 whilst repressing an abortive rising of the Christians in parts of Bulgaria. The defiance by the Porte of the moral sentiment of Europe, when the punishment of those who were the active agents in perpetrating these crimes was called for by this and other countries, led to the Russo-Turkish war of 1877-8, which resulted, among other effects, in the emancipation of a large part of Bulgaria from the Turkish yoke.

"*Attachments* by fate or by falsehood reft."
Pringle: Afar in the Desert.

¶ Drawing the distinction between *inclination*, *attachment*, and *affection*, Crabb shows that *inclination* is the weakest of the three words. *Inclinations*, he says, arise of themselves, *attachments* are formed; *inclination*, moreover, has respect chiefly to things, *attachment* to either persons or things, and *affection* to persons only. "*Attachment*, as it regards persons, is not so powerful or solid as *affection*. Children are *attached* to those who will minister to their gratifications; they have an *affection* for their nearest and dearest relatives. *Attachment* is sometimes a tender sentiment between persons of different sexes; *affection* is an affair of the heart without distinction of sex. The passing *attachments* of young people are seldom entitled to serious notice; although sometimes they may ripen by long intercourse into a laudable and steady *affection*. Nothing is so delightful as to see *affection* among brothers and sisters."

B. *Technically (Law):*

If he keep out of the way, so that it cannot be put in force, then an attachment with proclamation follows, that is, an attachment coupled with a public proclamation requiring him to surrender himself. B. *Law:* The state or condition of being attainted, which, according to Blackstone, meant "stained" or "blackened."

I. *In England:*

1. *Formerly.* Attainder, in its old and more rigorous form, followed, not when a criminal was convicted of a capital offence, but when sentence of death upon him was pronounced. No formalities were then needed to attaint him; the attainder followed as a natural consequence from the sentence. He was regarded as being out of the pale and protection of the law. He was not allowed to be witness in any case. Nay, more, there were forfeiture of his real and personal estates, and the "corruption of his blood;" the last-mentioned phrase implying that not merely could he not inherit any property from his ancestors, but he could not transmit it to any descendants, all of whom, even to the remotest generations, were thus to suffer for a crime in which they had taken no part. (*Blackstone: Comment.*, bk. iv., ch. 29, &c.)

2. *Now.* By 3 & 4 William IV., c. 106, the consequences of attainder are, as much as possible, limited to the person who actually committed the capital offence, and by the 6 & 7 Victoria, c. 85, § 1, an attainted person may even in certain circumstances be witness in a court of law.

II. *In the United States:* The Constitution of the United States requires that "No bill of attainder shall be passed, and no attainder of treason, in consequence of a judicial sentence, shall work corruption of blood or forfeiture except during the life of the person attainted. (*Webster.*)

2. *Fig.:* To taint, to stain, to dim, obscure, to blacken, to darken, as an attainder was supposed to stain or blacken the person against whom it was directed. [ATTAINDER.] *Used—*

(*a*) Of a person's reputation.

"How would the sons of Troy, in arms renown'd,
And Troy's proud dames, whose garments sweep the ground,
Attaint the lustre of my former name,
Should Hector basely quit the field of fame?"

That Phœbus' golden face it did *attaint,*
As when a cloud his beames did overlay."
Spenser: F. Q., I. vii. 33, 34.

3. To corrupt, as the blood of a person under attainder was supposed to be legally "corrupted." [ATTAINT, *particip. adj.* (2).]

B. *Old Law:*

* 1. To declare a jury infamous, and inflict on them a punishment severe even to extravagance, on account of their having given a false verdict. [See ATTAINT, s., B. 1.] (*Blackstone: Comment.*, bk. iii., chaps. 23—25.)

2. To place one under an attainder, which is done upon sentence of outlawry, or on that of death for treason or felony. (*Blackstone: Comm.*, bk. iv. 29.) [ATTAINDER.] Formerly a man might be attainted in two ways: (1) By appearance, by which was meant that he really presented himself in the court, and was subject to attainder, having confessed his crime, been vanquished in battle, or adjudged guilty by a verdict. Or (2) by process, when having fled and failed to answer, after being five times called publicly in the county, he was at last outlawed for non-appearance.

The jury empanelled to try such a case was the grand one, consisting of twenty-four of the best men in the county; the appellation "grand" being used to distinguish it from the "petit," or small jury—the first one. If convicted, they were pronounced infamous, their goods were forfeited, their wives and families were turned out of doors, their houses razed, their trees rooted up, &c. At length the practice of setting aside verdicts, upon motion made for the purpose, and granting new trials, superseded the old system of attaints, which was finally swept away by 4 Geo. IV., c. 50. ¶ (*a*) Crabb thus distinguishes between the verbs to *attend*, to *mind*, to *regard*, to *heed*, and to *notice*:—*Attend* is the generic; the rest are specific terms. "To *mind* is to attend to a thing, so that it may not be forgotten; to *regard* is to look on a thing as of importance; to *heed* is to attend to a thing from a principle of caution; to *notice* is to think on that which strikes the senses . . . Children should always *attend* when spoken to, and *mind* what is said to them; they should *regard* the counsels of their parents, so as to make them the rule of their conduct, and *heed* their warnings, so as to avoid the evil; they should *notice* what passes before them, so as to apply it to some useful purpose."

(*c*) The following is the distinction between to *attend*, to *hearken*, and to *listen*:—"*Attend* is a mental action; *hearken*, both corporeal and mental; *listen*, simply corporeal. To *attend* is to have the mind engaged on what we hear; to *hearken* and *listen* are to strive to hear. People *attend* when they are addressed; they *hearken* to what is said by others; they *listen* to what passes between others." (*Crabb: Eng. Synon.*)

A. *Ordinary Language:*

I. The act of attending.

1. *Gen.:* The act of concentrating the mind on any object of sense or on any mental conception.

"Yet, while I recommend to our actresses a skilful *attention* to gesture, I would not have them study it in the looking-glass."—*Goldsmith: The Bee*, No. II.

2. *Spec.:* An act of civility; thoughtful consideration, kindness, or love shown to a person from appreciation of his or her character. (Often in the pl.)

"The Secretary shared largely in the *attentions* which were paid to his chief."—*Macaulay: Hist. Eng.*, ch. xxiii.

II. The state of being attended to.

". . . the labour bestowed by him upon what he has heretofore and now laid before the public, entitled him to candid attention . . ."—*Wordsworth: Preface to the Excursion.*

III. The power, ability, or faculty which man possesses to attend to anything. [B. 1.]

"Hardly any faculty is more important for the intellectual progress of man than the power of *attention*."—*Darwin: Descent of Man*, pt. i., ch. ii.

¶ *To draw or to call the attention to:* To point out to any one an object calculated to a greater or less extent to attract the notice.

"My *attention* was called to this subject."—*Darwin: Descent of Man*, pt. i., ch. i.

B. *Technically:*

1. *Mental Phil.:* Intelligent consciousness voluntarily applied; consciousness concentrated in order intellectually to conquer a particular object; the positive act of concentrating consciousness.

"*Attention* is consciousness and something more. It is consciousness voluntarily applied, under its law of limitation, to some determinate object; it is consciousness concentrated."—*Sir W. Hamilton: Metaph.*, vol. i., p. 238.

"*Attention* is consciousness applied by an act of will or desire under a particular law. . . . This law, which we call the law of limitation, is, that the intension of our knowledge is in the inverse ratio of its extension—in other words, that the fewer objects we consider at once, the clearer and more distinct will be our knowledge of them."—*Ibid.*, p. 246.

"*Attention*, then, is to consciousness what the contraction of the pupil is to sight; or to the eye of the mind what the microscope or telescope is to the bodily eye. The faculty of *attention* is not, therefore, a special faculty, but merely consciousness acting under the law of limitation to which it is subjected. But whatever be its relation to the special faculties, *attention* doubles all their efficiency, and affords them a power of which they would otherwise be destitute. It is, in fact, as we are at present constituted, the primary condition of their activity."—*Ibid.*, p. 248.

2. *Mil.:* A command given to soldiers, who for a time have been permitted to "stand at ease," to resume a more normal military attitude. When "Attention" is ordered, the hands are to fall smartly down the outside of the thighs, and the right foot to be brought up on a level with the left.

ạt-tĕn'-tĭve, * ạt-tĕn'-tỹve, *a.* [Fr. *attentif.*]

1. *Of persons:* With the mind fixed on the object to which the person is said to be attending; heedful. If the object be one of which the eye takes cognizance, then the eye is directed keenly to it; if one cognizable by the ear, then the ear is similarly intent; if on a book, then the eye and the mental powers are in operation; if its own thoughts are the subject of reflection, then the mind introverted becomes vividly conscious of its own working.

". . . Knowledge dwells
In heads replete with thoughts of other men;
Wisdom in minds *attentive* to their own."
Cowper: Task, bk. vi.

¶ It may be used also figuratively of God.

". . . let now thine ear be *attentive* to the prayer of thy servant. . . ."—*Nehem.* i. 11.
